Modern Optics, Electronics and High Precision Techniques in Cell Biology Gerhard Isenberg, 2012-12-06 In spite of tremendous scientific progress over the past years cell biologists do not yet understand the fundamental processes that determine the life cycle of a cell Such are cell movement and cell spreading cell division cell communication cell signaling cell regeneration and cell death Biochemistry has enabled us to recognize and to isolate an overwhelming number of new proteins In vitro assays and the reinjection of proteins into

cells and tissues have provided insights into molecular functions and cellular mechanisms The renaissance of the genetic approach by applying restriction enzymes and vectors PCR and antisense technology has enabled us to overexpress certain cellular products to make altered constructs of cell components or to create knock out mutants that entirely lack the factor of interest Amazingly enough all these molecular toys have led to a stream of information but not in a comparable degree to a better understanding Has the puzzle become too complex to get solved or are the windows too small that we are looking through As an attempt to answer both questions the aim of the present monograph Modern Optics Electronics and High Precision Techniques in Cell Biology is first to provide cell and molecular biologists with a whole new scope of easily applicable techniques including brand new optical biophysical physicochemical and biosensoric devices Secondly these newly developed techniques allow us to look at cells and biological systems as a whole
