Cyclic Homology Grundlehren Der Mathematischen Wissenschaften 301:

   Cohomological Methods in Homotopy Theory Jaume Aguade,Carles Broto,Carles Casacuberta,2012-12-06 This book contains a collection of articles summarizing the state of knowledge in a large portion of modern homotopy theory A call for articles was made on the occasion of an emphasis semester organized by the Centre de Recerca Matemtica in Bellaterra Barcelona in 1998 The main topics treated in the book include abstract features of stable and unstable homotopy homotopical localizations p compact groups H spaces classifying spaces for proper actions cohomology of discrete groups K theory and other generalized cohomology theories configuration spaces and Lusternik Schnirelmann category The book is addressed to all mathematicians interested in homotopy theory and in geometric aspects of group theory New research directions in topology are highlighted Moreover this informative and educational book serves as a welcome reference for many new results and recent methods   *From Differential Geometry to Non-commutative Geometry and Topology* Neculai S. Teleman,2019-11-10 This book aims to provide a friendly introduction to non commutative geometry It studies index theory from a classical differential geometry perspective up to the point where classical differential geometry methods become insufficient It then presents non commutative geometry as a natural continuation of classical differential geometry It thereby aims to provide a natural link between classical differential geometry and non commutative geometry The book shows that the index formula is a topological statement and ends with non commutative topology   **Quantum Riemannian Geometry** Edwin J. Beggs,Shahn Majid,2020-01-31 This book provides a comprehensive account of a modern generalisation of differential geometry in which coordinates need not commute This requires a reinvention of differential geometry that refers only to the coordinate algebra now possibly noncommutative rather than to actual points Such a theory is needed for the geometry of Hopf algebras or quantum groups which provide key examples as well as in physics to model quantum gravity effects in the form of quantum spacetime The mathematical formalism can be applied to any algebra and includes graph geometry and a Lie theory of finite groups Even the algebra of 2 x 2 matrices turns out to admit a rich moduli of quantum Riemannian geometries The approach taken is a bottom up one in which the different layers of geometry are built up in succession starting from differential forms and proceeding up to the notion of a quantum Levi Civita bimodule connection geometric Laplacians and in some cases Dirac operators The book also covers elements of Connes approach to the subject coming from cyclic cohomology and spectral triples Other topics include various other cohomology theories holomorphic structures and noncommutative D modules A unique feature of the book is its constructive approach and its wealth of examples drawn from a large body of literature in mathematical physics now put on a firm algebraic footing Including exercises with solutions it can be used as a textbook for advanced courses as well as a reference for researchers   **Open Problems in Mathematics** John Forbes Nash, Jr.,Michael Th. Rassias,2016-07-05 The goal in putting together this unique compilation was to present the current status of the solutions to some of the most essential open problems in pure and

applied mathematics Emphasis is also given to problems in interdisciplinary research for which mathematics plays a key role This volume comprises highly selected contributions by some of the most eminent mathematicians in the international mathematical community on longstanding problems in very active domains of mathematical research A joint preface by the two volume editors is followed by a personal farewell to John F Nash Jr written by Michael Th Rassias An introduction by Mikhail Gromov highlights some of Nash s legendary mathematical achievements The treatment in this book includes open problems in the following fields algebraic geometry number theory analysis discrete mathematics PDEs differential geometry topology K theory game theory fluid mechanics dynamical systems and ergodic theory cryptography theoretical computer science and more Extensive discussions surrounding the progress made for each problem are designed to reach a wide community of readers from graduate students and established research mathematicians to physicists computer scientists economists and research scientists who are looking to develop essential and modern new methods and theories to solve a variety of open problems **Superschool on Derived Categories and D-branes** Matthew Ballard,Charles Doran,David Favero,Eric Sharpe,2018-08-21 This book consists of a series of introductory lectures on mirror symmetry and its surrounding topics These lectures were provided by participants in the PIMS Superschool for Derived Categories and D branes in July 2016 Together they form a comprehensive introduction to the field that integrates perspectives from mathematicians and physicists alike These proceedings provide a pleasant and broad introduction into modern research topics surrounding string theory and mirror symmetry that is approachable to readers new to the subjects These topics include constructions of various mirror pairs approaches to mirror symmetry connections to homological algebra and physical motivations Of particular interest is the connection between GLSMs D branes birational geometry and derived categories which is explained both from a physical and mathematical perspective The introductory lectures provided herein highlight many features of this emerging field and give concrete connections between the physics and the math Mathematical readers will come away with a broader perspective on this field and a bit of physical intuition while physicists will gain an introductory overview of the developing mathematical realization of physical predictions Perspectives on Noncommutative Geometry Masoud Khalkhali,2011 This volume represents the proceedings of the Noncommutative Geometry Workshop that was held as part of the thematic program on operator algebras at the Fields Institute in May 2008 Pioneered by Alain Connes starting in the late 1970s noncommutative geometry was originally inspired by global analysis topology operator algebras and quantum physics Its main applications were to settle some long standing conjectures such as the Novikov conjecture and the Baum Connes conjecture Next came the impact of spectral geometry and the way the spectrum of a geometric operator like the Laplacian holds information about the geometry and topology of a manifold as in the celebrated Weyl law This has now been vastly generalized through Connes notion of spectral triples Finally recent years have witnessed the impact of number theory algebraic geometry and the theory of motives and quantum field theory on

noncommutative geometry Almost all of these aspects are touched upon with new results in the papers of this volume This book is intended for graduate students and researchers in both mathematics and theoretical physics who are interested in noncommutative geometry and its applications   *Schriftenreihe des Mathematischen Instituts der Universität Münster* ,2001   **Noncommutative Geometry, Arithmetic, and Related Topics** Caterina Consani,Alain Connes,2011 Mathematics Institute these essays collectively provide mathematicians and physicists with a comprehensive resource on the topic   *Algebraic and Geometric Topology* ,2001   **Proceedings of A. Razmadze Mathematical Institute** ,2003   Beiträge Zur Algebra und Geometrie ,2003   **Algebra Colloquium** ,2007   **Pure and Applied Mathematics Quarterly** ,2007   *Annales Scientifiques de L'École Normale Supérieure* ,2008   *Cyclic Homology* Jean-Louis Loday,2013-03-09 From the reviews This is a very interesting book containing material for a comprehensive study of the cyclid homological theory of algebras cyclic sets and S1 spaces Lie algebras and algebraic K theory and an introduction to Connes work and recent results on the Novikov conjecture The book requires a knowledge of homological algebra and Lie algebra theory as well as basic technics coming from algebraic topology The bibliographic comments at the end of each chapter offer good suggestions for further reading and research The book can be strongly recommended to anybody interested in noncommutative geometry contemporary algebraic topology and related topics European Mathematical Society Newsletter In this second edition the authors have added a chapter 13 on MacLane co homology   **Chinese Journal of Contemporary Mathematics** ,2006   Die Homologie der Modulräume berandeter Riemannscher Flächen von kleinem Geschlecht Ralf Ehrenfried,1998   **Quantization of Noncommutative Poisson Manifolds** Xiang Tang,2004   **Mathematical Reviews** ,1998   **Nonabelian Algebraic Models for Classical Homotopy Types** Eric Ramón Antokoletz,2008
