Extrasolar Planets Hans Deeg,Juan Antonio Belmonte,Antonio Aparicio,2007-10-18 This 2007 volume presents the lectures from the sixteenth Winter School of the Instituto de Astrofísica de Canarias which was dedicated to extrasolar planets Research into extrasolar planets is one of the most exciting fields of astrophysics and the past decade has seen a research leap from speculations on the existence of planets orbiting other stars to the discovery of around 200 planets to date The book covers a wide range of issues from the state of the art observational techniques used to detect extrasolar planets to the characterizations of these planets and the techniques used in the remote detection of life It also looks at the insights we can gain from our own Solar System and how we can apply them The contributors all of high standing in the field provide a balanced and varied introduction to extrasolar planets for research astronomers and graduate students bridging theoretical developments and observational advances

Solar System Astrophysics Eugene F. Milone,William J.F. Wilson,2014-01-30 The second edition of Solar System Astrophysics Planetary Atmospheres and the Outer Solar System provides a timely update of our knowledge of planetary atmospheres and of the bodies of the outer solar system and their analogs in other planetary systems This volume begins with an expanded treatment of the physics chemistry and meteorology of the atmospheres of the Earth Venus and Mars moving on to their magnetospheres and then to a full discussion of the gas and ice giants and their properties From here attention switches to the small bodies of the solar system beginning with the natural satellites The comets meteors meteorites and asteroids are discussed in order and the volume concludes with the origin and evolution of our solar system

Finally a fully revised section on extrasolar planetary systems puts the development of our system in a wider and increasingly well understood galactic context All of the material is presented within a framework of historical importance This book and its sister volume Solar System Astrophysics Background Science and the Inner Solar system are pedagogically well written providing clearly illustrated explanations for example of such topics as the numerical integration of the Adams Williamson equation the equations of state in planetary interiors and atmospheres Maxwell s equations as applied to planetary ionospheres and magnetospheres and the physics and chemistry of the Habitable Zone in planetary systems Together the volumes form a comprehensive text for any university course that aims to deal with all aspects of solar and extra solar planetary systems They will appeal separately to the intellectually curious who would like to know how just how far our knowledge of the solar system has progressed in recent years

Transiting Planets (IAU S253) International Astronomical Union, Symposium, 2009-04-16 The discovery of planets around stars other than the Sun within the past 15 years has opened up one of the largest and most exciting new fields in modern astronomy The transit method of detecting exoplanets has revealed more information about individual planets than any other method of detection This volume the proceedings of IAU Symposium 253 contains a description of the latest development in the field of transiting extrasolar planets Topical reviews and short contributions from more than one hundred authors present the latest results in the field from the photometric transit searches for transiting planets through observational studies of these planets to the consequences for theories of planet formation evolution and planetary atmospheres Presenting the latest research it is an important resource for graduate students and researchers working in astronomy and planetary sciences

Measurements of Spin-Orbit Angles for Transiting Systems Teruyuki Hirano, 2014-06-26 This thesis presents accurate analyses of the spin orbit angle for many remarkable transiting exoplanetary systems including the first measurement of the Rossiter McLaughlin effect for a multiple transiting system The author presents the observational methods needed to probe the spin orbit angle the relation between the stellar spin axis and planetary orbital axis Measurements of the spin orbit angle provide us a unique and valuable opportunity to understand the origin of close in giant exoplanets called hot Jupiters The first method introduced involves observations of the Rossiter McLaughlin effect RM effect The author points out the issues with the previous theoretical modeling of the RM effect and derives a new and improved theory Applications of the new theory to observational data are also presented for a number of remarkable systems and the author shows that the new theory minimizes the systematic errors by applying it to the observational data The author also describes another method for constraining the spin orbit angle by combining the measurements of stellar flux variations due to dark spots on the stellar surface with the projected stellar rotational velocity measured via spectroscopy the spin orbit angles along the line of sight are constrained for the transiting exoplanetary systems reported by the Kepler space telescope

The contributions were organized in topical sections as follows: Big Data analysis and management, data science, big data applications, and information security. **Exoplanets** Sara Seager, 2011-01-15 For the first time in human history we know for certain the existence of planets around other stars. Now the fastest growing field in space science, the time is right for this fundamental source book on the topic which will lay the foundation for its continued growth. *Exoplanets* serves as both an introduction for the non-specialist and a foundation for the techniques and equations used in exoplanet observation by those dedicated to the field.
