Imprecise Computation in Real-time Control Systems Changwen Liu, University of Illinois at Urbana-Champaign. Department of Computer Science, 1995 Abstract The thesis is concerned with the behavior of corrupted real time control systems and their corrupted trajectories The difference between the corrupted trajectory and the precise trajectory is called the tracking error We analyze the consequence of imprecise computation caused by corrupted input and or prematurely terminated output computation on tracking errors for single input single output and multiple input multiple output time invariant systems with deterministic errors as well as random

errors We establish the tracking error models and give upper bounds of the tracking errors We find conditions under which the imprecise computation has certain desired convergence properties and show how to design control systems so that the systems have satisfactory performance *Nonlinear Discrete-Time Design Methods for Missile Flight Control Systems*, 2004

Design methods for discrete time linear control systems have reached an advanced level of maturity However the direct design of nonlinear discrete time control systems remains to be fully developed Although textbooks are available on nonlinear control system design literature on discrete time nonlinear control system design is rather sparse From an applications point of view discrete time designs are important because most controllers are implemented using digital computers Design techniques of interest in this paper are those that permit the synthesis of discrete time controllers for continuous time nonlinear dynamic systems The present work is motivated by the need to implement nonlinear control system designs synthesized using computer aided design techniques^{6 7} onboard missiles Three different discrete time control system design techniques have been investigated in the present research All of them are discrete time analogs of continuous time nonlinear system design techniques discussed in the literature The first approach is the discrete time version of the state dependent Riccati equation SDRE technique discussed in References 8 and 9 The second design technique is a discrete time version of the recursive backstepping¹⁰ methodology and employs discretized system dynamics The third technique is the discrete time version of the feedback linearization design approach In this last technique the system dynamics is first transformed into a linear time invariant form through the definition of state variable feedback The transformed model is then converted into discrete time form by defining sample holds at the input and the outputs The discretized is linear model is then used for control system design All three techniques have been employed for the design of missile flight control systems Section II will present each of the design techniques in detail
