

CENTIPEDES vs. MILLIPEDES

Centipedes and millipedes are both from the phylum **Arthropoda**, which means they are not technically insects! They are descended from a common ancestor—**Arthropleura**, a giant centipede-like creature that lived over 300 million years ago in North America. It was the largest land-dwelling invertebrate of all time, reaching up to 8 1/2 feet in length! Today, these close relatives have very little in common besides their ancestry.

The most obvious difference between centipedes and millipedes is their legs. Centipedes have only one pair of legs attached to each body segment. Adults can have as few as 30 legs, or more than 300 legs!

LEGS

Millipedes have two pairs of legs attached to each body segment. This is because, while they were embryos, pairs of body segments fused together to create **diplosegments**. The smallest millipedes, like *Protura*, have only 10 legs, but the largest ones can have as many as 300 legs.

Centipedes are **carnivorous**. They eat other insects, including ants, beetles, and earthworms. The Amazonian giant centipede can even eat bigger animals like frogs, lizards, mice, and birds!

FOOD

Millipedes are **herbivorous detritivores**, which means they eat decomposing plant matter. Some *millipedes* will burrow out around an ant colony in order to eat the waste left by the ants.

Centipedes have two sharp **fangs** on their heads, which are poisonous. They use them to immobilize or eat their prey. A centipede's bite is not typically fatal to humans, but it is painful and can cause an allergic reaction. Don't pick a centipede!

DEFENSE

Millipedes do not have weapons like the centipede. Their defense mechanism is to curl into a ball, protecting their softer underbelly and legs while exposing only their hard shells. Many also have glands that excrete a **caustic** or irritating liquid to deter predators.

Centipedes can move very fast! They need to be able to move quickly in order to catch their prey.

MOVEMENT

Millipedes move much more slowly. They may not be able to outrun their predators, but their many small legs allow them to burrow powerfully.

Centipedes have two pair of **antennae**—one pair on their heads, and one pair on their bodies. This makes up for the fact their centipede's eyesight is very poor.

SENSES

Millipedes only have one pair of antennae on their heads. Their **eyesight**, on the other hand, is significantly better than a centipede's.

Centipedes do not mate with each other. Instead, the male centipede produces a **spermatophore**, which is a little package of sperm. The female picks it up and stores it for use later, when she is ready to produce eggs.

REPRODUCTION

Millipedes mate through copulations.
