**Coronary Laser Angioplasty** K.R. Karsch,K.K. Haase,2013-03-09 Since the development of the first laser generator by Maiman in 1960 laser energy has gained increased interest and has subsequently been used in various fields of application Due to its high energy density combined with a sharply defined irradiation field laser has aroused great expectations especially since laser beams have been used very successfully in various fields especially technology and medicine Medical and surgical applications of the laser were among the first and have been of undisputed benefit in for example ophthalmologic interventions such as coagulation of the retina or for endoscopic tumorectomy in the bronchial gastrointestinal and urogenital tracts Consequently considerable research effort was made to also apply laser techniques in interventional cardiology for the treatment of atherosclerosis aimed at removing plaque material from stenosed tissue or occluded arteries and recanalizing tough and calcified segments unsuitable for the well established technique of balloon dilatation Ablating atheroma rather than pushing it aside was thought to achieve better results However it was found that the laser may create rough edged cuts partly with substantial thermal or mechanical damage to the surrounding tissue consequently provoking preconditions for unwanted restenosis Different types of laser generators and probes have therefore been investigated in arterial vessels mostly focusing on indirect laser effects Intravascular probes with laser heated metal tips were used as well as balloon catheters with an incorporated laser fiber designed to heat the surrounding tissue outside the balloon and to in effect iron out the plaque
