

# What is Neo-Darwinian Evolution?

- Says that life started when certain chemicals formed the first cell
- Over millions of years, offspring from that cell changed and grew in complexity, resulting in the great variety we see today
- In other words, all species originated from a common ancestor, advancing from one generation to the next.

Note: "Neo-Darwinian Evolution" is shortened to "Evolution" in the following slides.

**Darwinian, Neo-Darwinian, and Non-Darwinian Evolution** Lucien Marie Le Cam, Jerzy Neyman, Elizabeth L. Scott, 1972      **Phylogeny of the Primates** W. Luckett, 2012-12-06 The past decade has witnessed a tremendous surge of interest in varied aspects of primate biology encompassing virtually all disciplines of the biological sciences Regardless of whether these studies have been approached from a paleontological morphological developmental biochemical neuroanatomical or behavioral point of view one underlying theme has been a common interest in the possible phylogenetic relationships suggested by the results of such studies In some cases sound taxonomic principles have not been followed in the interpretation of these data and this has led to skepticism among many taxonomists with regard to the validity of some of the genealogical relationships and conclusions suggested by comparative studies of living primates It is generally agreed that the fossil record alone provides the essential time dimension for directly observing changes in characteristics but unfortunately this record is limited both in the number of genera represented and particularly in the incomplete nature of the available preserved material On the other hand extensive comparative analyses of numerous characteristics in living primates have provided additional insight into possible phylogenetic relationships despite the lack of a time dimension Such studies of both fossil and living primates are enhanced considerably by a cladistic analysis of the probable primitive ancestral or advanced derived condition of each character state discussed based upon their distribution and ontogeny wherever possible in a wide variety of primate and nonprimate taxa including other eutherian mammals marsupials monotremes and reptiles

**Imagining the Darwinian Revolution** Ian Hesketh, 2022-06-14 This volume considers the relationship between the development of evolution and its historical representations by focusing on the so called Darwinian Revolution The very idea of the Darwinian Revolution is a historical construct devised to help explain the changing scientific and cultural landscape that was ushered in by Charles Darwin's singular contribution to natural science And yet since at least the 1980s science historians have moved away from traditional great man narratives to focus on the collective role that previously neglected figures have played in formative debates of evolutionary theory Darwin they argue was not the driving force behind the popularization of evolution in the nineteenth century This volume moves the conversation forward by bringing Darwin back into the frame recognizing that while he was not the only important evolutionist his name and image came to signify evolution itself both in the popular imagination as well as in the work and writings of other evolutionists Together contributors explore how the history of evolution has been interpreted deployed and exploited to fashion the science behind our changing understandings of evolution from the nineteenth century to the present      **A Companion to the Philosophy of Biology** Sahotra Sarkar, Anya Plutynski, 2010-11-08 A COMPANION TO THE PHILOSOPHY OF BIOLOGY Sarkar is to be
