**Emphysema Solution** June Corder, 2021-08-12 Emphysema is a disease of the lungs that usually develops after many years of smoking Both chronic bronchitis and emphysema belong to a group of lung diseases known as chronic obstructive pulmonary disease COPD Once it develops emphysema can't be reversed This is why not smoking or stopping smoking is very important Emphysema is a condition that involves damage to the walls of the air sacs alveoli of the lung Alveoli are small thin walled very fragile air sacs located in clusters at the end of the bronchial tubes deep inside the lungs There are about 300 million alveoli in normal lungs As you breathe in air the alveoli stretch drawing oxygen in and transporting it to the blood When you exhale the alveoli shrink forcing carbon dioxide out of the body When emphysema develops the alveoli and lung tissue are destroyed With this damage the alveoli cannot support the bronchial tubes The tubes collapse and cause an obstruction a blockage which traps air inside the lungs Too much air trapped in the lungs can give some patients a barrel chested appearance Also because there are fewer alveoli less oxygen will be able to move into the bloodstream Over 3 million people in the United States have been diagnosed with emphysema Over 11 million Americans have COPD Emphysema is most common in men between the ages of 50 and 70 GET YOUR COPY TODAY BY SCROLLING UP AND CLICKING BUY NOW TO GET YOUR COPY TODAY *Pulmonary Rehabilitation - E-Book* John E.
