Corps Locaux 2nd Edition:

Local Fields and Their Extensions: Second Edition Ivan B. Fesenko, S. V. Vostokov, 2002-07-17 This book offers a modern exposition of the arithmetical properties of local fields using explicit and constructive tools and methods. It has been ten years since the publication of the first edition and according to Mathematical Reviews 1 000 papers on local fields have been published during that period. This edition incorporates improvements to the first edition with 60 additional pages reflecting several aspects of the developments in local number theory. The volume consists of four parts: elementary properties of local fields, class field theory for various types of local fields and generalizations, explicit formulas for the Hilbert pairing and Milnor groups of fields and of local fields. The first three parts essentially simplify, revise and update the first edition. The book includes the following recent topics: Fontaine-Wintenberger theory of arithmetically profinite extensions and fields of norms, explicit noncohomological approach to the reciprocity map with a review of all other approaches to local class field theory, Fesenko's class field theory for local fields with perfect residue field, simplified updated presentation of Vostokov's explicit formulas for the Hilbert norm residue symbol and Milnor groups of local fields. Numerous exercises introduce the reader to other important recent results in local number theory and an extensive bibliography provides a guide to related areas.

Handbook of Algebra, 1995-12-18 Handbook of Algebra defines algebra as consisting of many different ideas, concepts and results. Even the nonspecialist is likely to encounter most of these either somewhere in the literature disguised as a definition or a theorem or to hear about them and feel the need for more information. Each chapter of the book combines some of the features of both a graduate level textbook and a research level survey. This book is divided into eight sections. Section 1A focuses on linear algebra and discusses such concepts as matrix functions and equations and random matrices. Section 1B covers linear dependence and discusses matroids. Section 1D focuses on fields, Galois Theory and algebraic number theory. Section 1F tackles generalizations of fields and related objects. Section 2A focuses on category theory including the topos theory and categorical structures. Section 2B discusses homological algebra, cohomology and cohomological methods in algebra. Section 3A focuses on commutative rings and algebras. Finally, Section 3B focuses on associative rings and algebras. This book will be of interest to mathematicians, logicians and computer scientists. **Algebraic Geometry and Its**

New Horizons in pro-p Groups Marcus du Sautoy, Dan Segal, Aner Shalev, 2012-12-06 A pro p group is the inverse limit of some system of finite p groups that is of groups of prime power order where the prime conventionally denoted p is fixed. Thus from one point of view to study a pro p group is the same as studying an infinite family of finite groups but a pro p group is also a compact topological group and the compactness works its usual magic to bring infinite problems down to manageable proportions. The p -adic integers appeared about a century ago but the systematic study of pro p groups in general is a fairly recent development. Although much has been discovered many avenues remain to be explored the purpose of this book is to

present a coherent account of the considerable achievements of the last several years and to point the way forward Thus our aim is both to stimulate research and to provide the comprehensive background on which that research must be based The chapters cover a wide range In order to ensure the most authoritative account we have arranged for each chapter to be written by a leading contributor or contributors to the topic in question Pro p groups appear in several different though sometimes overlapping contexts

Néron Models Siegfried Bosch, Werner Lütkebohmert, Michel Raynaud, 2012-12-06 N ron models were invented by A N ron in the early 1960s in order to study the integral structure of abelian varieties over number fields Since then arithmeticians and algebraic geometers have applied the theory of N ron models with great success Quite recently new developments in arithmetic algebraic geometry have prompted a desire to understand more about N ron models and even to go back to the basics of their construction The authors have taken this as their incentive to present a comprehensive treatment of N ron models This volume of the renowned *Ergebnisse* series provides a detailed demonstration of the construction of N ron models from the point of view of Grothendieck s algebraic geometry In the second part of the book the relationship between N ron models and the relative Picard functor in the case of Jacobian varieties is explained The authors helpfully remind the reader of some important standard techniques of algebraic geometry A special chapter surveys the theory of the Picard functor
