## **Correlation Analysis In Chemistry Of Solutions:**

Correlation Analysis in Chemistry of Solutions Roman Makitra, Anatolij Turovsky, Gennady Zaikov, 2004-07-01 The behavior of substances in solutions may not be adequately characterized by the effect of any single physicochemical parameter of solvents nor are numerous semi empirical scales of the solvent effect their a polarity suitable for their limited selections only In recent decades it has been found that the variation of reaction rate constants in solutions or that spectral parameters of dissolved substances are determined by the total effect of different solvation processes This monograph presents numerous examples of such an approach and characterizes various empirical and semi empirical scales of solvent properties It is shown that additional consideration of some structural parameters of solvents namely their cohesive energy and the molar volume may provide for spreading this approach on homolytical and catalytic reaction It is also shown that for the solvolysis reaction one of the excessive reagents may represent either a reagent or a solvent which requires additional consideration of its structural characteristics in the Hammett equation The application of the principle of free energy linearity also allowed adequate generalization of data on the effect of solvents on different physicochemical processes such as dissolution of gases and solids in various solvents swelling of polymers and solid fossil fuels coal extraction adsorption absorption diffusion and chromatography Special attention is paid to substance distribution between two immiscible phases Properties of both an extractive phase and an active extractant dissolved in inert diluter are taken into account The majority of these processes indicate the efficiency of solvent self association factor that defines the energy consumption for formation of a void for an alien molecule injection

**Correlation Analysis in Chemistry** N. Chapman, 2012-12-06 This book *Correlation Analysis in Chemistry Recent Advances* is a sequel to our *Advances in Linear Free Energy Relationships* The change in the title is designed to reflect more accurately the nature of the field and the contents of the volume The term LFER is still widely used but it is often applied rather loosely to correlation equations that are not LFER in the restricted sense of a relationship involving logarithms of rate or equilibrium constants on each side of the equation The term correlation analysis seems to us more appropriate for the whole subject The use of this term has compelled us also to introduce chemistry into the title we have preferred not to prefix this with organic on the grounds that several areas of interest are not organic chemistry as usually understood although of course traditional applications of the basic relationships associated with the names of Hammett and of Taft continue to be of interest In the first volume we sought through our authors to provide a series of general articles covering the various aspects of the field as they seemed to us Since the book was the first international
