Descriptive Complexity and Finite Models Neil Immerman, 1997 We hope that this small volume will suggest directions of synergy and contact for future researchers to build upon creating connections and making discoveries that will help explain some of the many mysteries of computation The Preface Finite model theory can be succinctly described as the study of logics on finite structures It is an area of research existing between mathematical logic and computer science This area has been developing through continuous interaction with computational complexity database theory and combinatorics The volume presents articles by leading researchers

Space in Weak Propositional Proof Systems Ilario Bonacina, 2018-01-11 This book considers logical proof systems from the point of view of their space complexity After an introduction to propositional proof complexity the author structures the book into three main parts Part I contains two chapters on resolution one containing results already known in the literature before this work and one focused on space in resolution and the author then moves on to polynomial calculus and its space complexity with a focus on the combinatorial technique to prove monomial space lower bounds The first chapter in Part II addresses the proof complexity and space complexity of the pigeon principles Then there is an interlude on a new type of game defined on bipartite graphs essentially independent from the rest of the book collecting some results on graph theory Finally Part III analyzes the size of resolution proofs in connection with the Strong Exponential Time Hypothesis SETH in complexity theory The book is appropriate for researchers in theoretical computer science in particular computational complexity

Reasoning Web. Explainable Artificial Intelligence Markus Krötzsch, Daria Stepanova, 2019-09-17 This volume contains lecture notes of the 15th Reasoning Web Summer School RW 2019 held in Bolzano Italy in September 2019 The research areas of Semantic Web Linked Data and Knowledge Graphs have recently received a lot of attention in academia and industry Since its inception in 2001 the Semantic Web has aimed at enriching the existing Web with meta data and processing methods so as to provide Web based systems with intelligent capabilities such as context awareness and decision support The Semantic Web vision has been driving many community efforts which have invested a lot of resources in

developing vocabularies and ontologies for annotating their resources semantically Besides ontologies rules have long been a central part of the Semantic Web framework and are available as one of its fundamental representation tools with logic serving as a unifying foundation Linked Data is a related research area which studies how one can make RDF data available on the Web and interconnect it with other data with the aim of increasing its value for everybody Knowledge Graphs have been shown useful not only for Web search as demonstrated by Google Bing etc but also in many application domains
