Design of Building Frames John S. Gero, Henry J. Cowan, 1976 *The Design of Tall Building Frames to Resist Wind* Clyde Tucker Morris, Albert Ward Ross, 1929 **The Design of Tall Building Frames to Resist Wind** Vicente Ancheta Aganad, 1929 **Integrated Design Product and Process Model for Building Frame Structures** Chang-Ho Lee, Richard Sause, Lehigh University. Advanced Technology for Large Structural Systems Center, 1997 Abstract An initial step in developing a computer integrated system for structural design is to create a formal description of the information and activities involved in design The formal description provides a clear understanding of and a theoretical basis for the computer integrated design system before the system is implemented An integrated design product and process model based on entities and relationships can be used to formally describe design information and design activities Product entities describe the information produced during the design process and process entities describe the associated activities The relationships among the entities of a design model include organizational interaction and sequence relationships Previous research has developed formal concepts and notation for representing the organizational relationships which provide a logical arrangement of product and process entities This report reviews these concepts and notation and then focuses on the representation of interaction relationships and sequence relationships Interaction relationships characterize the interdependencies among the design information of the product entities Sequence relationships describe the possible sequences of initiation of the design activities of the process entities The formal concepts and notation for representing product and process entities and the relationships among these entities are used to develop an integrated design product and process model for the design of building frame structures This model formally describes the information and activities involved in the design of building frame structures An example of the application of the model to the design of a building frame structure is given It shows how the model represents complex interdependencies among design information for the frame subsystems of the building frame structure and shows how sequences of the activities involved in the design of the building frame structure are represented The capabilities of the model to represent design information and activities as well as complex relationships among design information and activities makes the model and related concepts and notation an appropriate tool for developing new computer aided design systems for structural engineering design *Direct Displacement-based Design of Reinforced Concrete Building Frames* Shaun Loeding, Mervyn J. Seismic Design of Precast Concrete Building Structures fib Fédération internationale du béton, 2003-01-01 The aim of this state of art report is to present current practices for use of precast and prestressed concrete in countries in seismic regions to recommend good practice and to discuss current developments The report has been drafted by 30 contributors from nine different countries This state of art report covers state of the practice in various countries advantages and disadvantages of incorporating precast reinforced and prestressed concrete in construction lessons learned from previous earthquakes construction concepts design approaches primary lateral load resisting systems precast and prestressed concrete frame systems and structural walls including dual systems diaphragms of precast and prestressed concrete floor units modelling and analytical methods gravity load resisting systems foundations and miscellaneous elements shells folded plates stairs and architectural cladding panels Design equations are reported where necessary but the emphasis is on principles Ordinary cast in place reinforced concrete is not considered in

this report This fib state of the art report is intended to assist designers and constructors to provide safe and economical applications of structural precast concrete and at the same time to allow innovation in design and construction to continue This Bulletin N 27 was approved as an fib state of art report in autumn 2002 by fib Commission 7 Seismic design *The Seismic Design Handbook* Farzad Naeim, 1989-08-31 *The Design of Tall Steel Building Frames for Stability* Brian Ross Wood, 1978 This investigation attempts to evaluate procedures related to the design of tall steel building frames for stability Behavior of frames under various loading conditions are discussed along with analyses used to predict this behavior Traditional procedures used for the design of steel structures for stability are outlined along with proposed modifications of these design procedures A model that can be used to predict the ultimate strength of restrained columns permitted to sway is outlined This model is used to evaluate the predictions of various design methods The PA procedure for the design of steel structures for stability is outlined The rational and accuracy of this method is investigated A model for the analysis of inelastic sway subassemblages is developed and the effect of inelastic beam response on the behavior of restrained sway members is studied A stability check for use with the PA procedure is proposed Examples of a multi storey building frame designed using different design methods are presented along with a second order elastic plastic analysis of these frames Recommendations for the design of tall steel structures for stability are made *Computer Analysis and Design of Building Frames* Anthony H.
