Design And Construction Of Large Optical Telescopes:

The Design and Construction of Large Optical Telescopes Pierre Bely, 2006-05-26 There is no dearth of books on telescope optics and indeed optics is clearly a key element in the design and construction of telescopes. But it is by no means the only important element. As telescopes become larger and more costly other aspects such as structures pointing wavefront control enclosures and project management become just as critical. Although most of the technical knowledge required for all these fields is available in various specialized books journal articles and technical reports they are not necessarily written with application to telescopes in mind. This book is a first attempt at assembling in a single text the basic astronomical and engineering principles used in the design and construction of large telescopes. It aims to broadly cover all major aspects of the field from the fundamentals of astronomical observation to optics control systems structural mechanical and thermal engineering as well as specialized topics such as site selection and program management. This subject is so vast that an in depth treatment is obviously impractical. Our intent is therefore only to provide a comprehensive introduction to the essential aspects of telescope design and construction. This book will not replace specialized scientific and technical texts. But we hope that it will be useful for astronomers managers and systems engineers who seek a basic understanding of the underlying principles of telescope making and for specialists who wish to acquaint themselves with the fundamental requirements and approaches of their colleagues in other disciplines.

Integrated Modeling of Telescopes Torben Andersen, Anita Enmark, 2011-08-24

Ground or space based telescopes are becoming increasingly more complex and construction budgets are typically in the

billion dollar range Facing costs of this magnitude availability of engineering tools for prediction of performance and design optimization is imperative Establishment of simulation models combining different technical disciplines such as Structural Dynamics Control Engineering Optics and Thermal Engineering is indispensable Such models are normally called Integrated Models because they involve many different disciplines The models will play an increasingly larger role for design of future interdisciplinary optical systems in space or on ground The book concentrates on integrated modeling of optical and radio telescopes but the techniques presented will be applicable to a large variety of systems Hence the book will be of interest to optical and radio telescope designers designers of spacecrafts that include optical systems and to designers of various complex defense systems The book may also find use as a textbook for undergraduate and graduate courses within the field Adaptive Optics is an exciting and relatively new field originally dedicated to correction for blurring when imaging through the atmosphere Although this objective is still of high importance the concept of Adaptive Optics has recently evolved further Today the objective is not only to correct for atmospheric turbulence effects but also for a range of static and dynamical telescope aberrations The notion of adaptive optics has expanded to the field of Wavefront Control correcting for a variety of system aberrations Wavefront control systems maintain form and position of optical elements with high precision under static and dynamical load In many ways such systems replace the steel structures of traditional optical systems thereby providing much lighter systems with a performance not possible before Integrated Modeling is the foremost tool for studies of Wavefront Control for telescopes and complex optics and is therefore now of high importance Springer has recently published two books on telescopes *Reflecting Telescope Optics* by R Wilson and *The Design and Construction of Large Optical Telescopes* by P Bely Noting that a new and expensive generation of Extremely Large Telescopes with apertures in the 30 100 m range is on the way the present book on integrated modeling is a good match to the existing books and an appropriate specialization and continuation of some subjects dealt with in those books *Astronomical Structures and Mechanisms Technology* Joseph Antebi,D.
