Designing Autonomous Agents Theory Pra:

Designing Autonomous Agents Pattie Maes, 1990 Designing Autonomous Agents provides a summary and overview of the radically different architectures that have been developed over the past few years for organizing robots. These architectures have led to major breakthroughs that promise to revolutionize the study of autonomous agents and perhaps artificial intelligence in general. The new architectures emphasize more direct coupling of sensing to action, distributedness and decentralization, dynamic interaction with the environment and intrinsic mechanisms to cope with limited resources and incomplete knowledge. The research discussed here encompasses such important ideas as emergent functionality, task level decomposition and reasoning methods such as analogical representations and visual operations that make the task of perception more realistic.

[Virtual Interaction: Interaction in Virtual Inhabited 3D Worlds](#) E. Granum, Lars Qvortrup, B. Holmqvist, S. Kolstrup, K. Halskov Madsen, 2013-03-09. Lars Qvortrup: The world of interactive 3D multimedia is a cross-institutional world. Here researchers from media studies, linguistics, dramaturgy, media technology, 3D modelling, robotics, computer science, sociology, etc. etc. meet. In order not to create a new tower of Babel, it is important to develop a set of common concepts and references. This is the aim of the first section of the book. In Chapter 2, Jens F. Jensen identifies the roots of interaction and interactivity in media studies, literature studies and computer science and presents definitions of interaction as something going on among agents and agents and objects and of interactivity as a property of media supporting interaction. Similarly, he makes a classification of human users, avatars, autonomous agents and objects demonstrating that no universal differences can be made. We are dealing with a continuum. While Jensen approaches these categories from a semiotic point of view, in Chapter 3, Peer Mylov discusses similar issues from a psychological point of view. Seen from the user's perspective, a basic difference is that between stage and back stage or rather front stage, i.e. between

the real I and we and the virtual representational I and we Focusing on the computer as a stage in Chapter 4 Kjolner and Lehmann use the theatre metaphor to conceptualize the stage phenomena and the relationship between stage and front stage

carefully arranged book is mainly based on work done by the Intelligent Systems Research Group at BT Laboratories essentially in cooperation with internationally leading scientists from outside BT It opens with a detailed introduction surveying the area and putting the work presented in context Conceptual issues surrounding intelligent agents and multi agent systems are investigated and the practical and industrial applicability of this exciting new technology is demonstrated One section is devoted to the rationale philosophy and techniques of the emerging area of soft computing The final section outlines the broader context in dealing with machine intelligence in general and intelligent software systems in particular

TELEMATICS AND INFORMATICS: AN INTERNATIONAL JOURNAL ON TELECOMMUNICATIONS & INFORMATION TECHNOLOGY ,1992 *Integrating Practice, Theory, and Design for Engineers* P. K. Raju,2001 **Anti-boxology** Phoebe Sengers,1998 Abstract Artificial Intelligence AI the design of technology with attributes that we traditionally associate with living beings generally follows the broader scientific tradition of focusing on technical problems and their solutions within a relatively constrained framework The cultural studies of science on the other hand insists that scientific work should be understood as it springs from and influences other cultural phenomena including the background of metaphors and assumptions that influence the way scientists do their work In this thesis I explore the possibilities for AI and the cultural studies of science to engage in a mutually beneficial alliance by studying AI as a culturally situated activity and by using results of that study to generate novel technology Specifically I focus on the design of autonomous agents programs which are intended to represent a complete person animal or character In the alternative AI tradition these agents are created from a set of independent building blocks termed behaviors A major open question is how these behaviors can be synthesized to create an agent with overall coherent behavior I trace the problems in behavior integration to a strategy called atomization that AI shares with industrialization and psychiatric institutionalization Atomization is the process of breaking agents into modular chunks with limited interaction and represents a catch 22 for AI while this strategy is essential for building understandable code it is fatal for creating agents that have the overall coherence we have come to associate with living beings I tackle this problem of integration by redefining the notion of agent Instead of seeing agents as autonomous creatures with little reference to their sociocultural context I suggest that agents can be thought of in the style of cultural studies as a form of communication between the agent s designer and the audience which will try to comprehend the agent s activity With this metaphor as a basis it becomes clear that we need to integrate not the agent s internally defined code but the way in which the agent presents itself to the user Narrative psychology suggests that agents will be maximally comprehensible as intentional beings if they are structured to provide cues for narrative I therefore build an agent architecture the Expressivator which provides support for narratively comprehensible agents most notably by using behavioral transitions to link atomic behaviours into narrative sequences *A Neuro-computational Mobile Robot Architecture for Mapping Localization and Navigation* Vassilios Morellas,1995 **Intelligent Agents** ,1998 **Intelligent**
