Designing Intelligence A Framework For Smart Systems:

Designing Intelligence Steven H. Kim, 1990 The study of intelligent systems has assumed increasing importance as computers have become integrated into scientific and technological processes Such systems are used by biologists in modeling adaptive structures by cognitive psychologists looking at reasoning mechanisms by engineers working with microprocessor based devices of all kinds by industrial planners of automated factories and in many kinds of information and office management networks However there is no accepted general theory nor even a coherent framework for discussing such developments The aim of this text is to present a general basis for analyzing and synthesizing natural and artificial intelligent systems fusing theoretical models with a set of relationships or behavioral principles Written at the graduate level the book will be highly useful in courses for mechanical engineers and computer scientists It will also have wide appeal for researchers and scientists involved in using and designing computer based intelligent systems

Managing Expert Systems Efraim Turban, Jay Liebowitz, 1992-01-01 Managing Expert Systems explores the trends in expert systems development and implementation As top authorities in the field of ES Turban and Liebowitz examine the factors that contribute to the development of a successful expert system

Learning and Coordination S.H. Kim, 2012-12-06 Intelligent systems of the natural kind are adaptive and robust they learn over time and degrade gracefully under stress If artificial systems are to display a similar level of sophistication an organizing framework and operating principles are required to manage the resulting complexity of design and behavior This book presents a general framework for adaptive systems The utility of the comprehensive framework is demonstrated by tailoring it to particular models of computational learning ranging from neural networks to declarative logic The key to robustness lies in distributed decision making An exemplar of this strategy is the neural network in both its biological and synthetic forms In a neural network the knowledge is encoded in the collection of cells and their linkages rather than in any single component Distributed decision making is even more apparent in the case of independent agents For a population of autonomous agents their proper coordination may well be more instrumental for attaining their objectives than are their individual capabilities This book probes the problems and opportunities arising from autonomous agents acting individually and collectively Following the general framework for learning systems and its application to neural networks the coordination of independent agents through game theory is explored Finally the utility of game theory for artificial agents is revealed through a case study in robotic coordination Given the universality of the subjects learning behavior and coordinative strategies in uncertain environments this book will be of interest to students and researchers in various disciplines ranging from all areas of engineering to the computing disciplines from the life sciences to the physical sciences and from the management arts to social studies
