Design and Construction of Levees, 1995 *Design and Construction of Levees* United States. Army. Corps of Engineers, 2004-10 The purpose of this manual is to present basic principles used in the design and construction of earth levees The term levee as used herein is defined as an embankment whose primary purpose is to furnish flood protection from seasonal high water and which is therefore subject to water loading for periods of only a few days or weeks a year Embankments that are subject to water loading for prolonged periods longer than normal flood protection requirements or permanently should be designed in accordance with earth dam criteria rather than the levee criteria given herein Even though levees are similar to small earth dams they differ from earth dams in the following important respects a a levee embankment may become saturated for only a short period of time beyond the limit of capillary saturation b levee alignment is dictated primarily by flood protection requirements which often results in construction on poor foundations and c borrow is generally obtained from shallow pits or from channels excavated adjacent to the levee which produce fill material that is often heterogeneous and far from ideal Selection of the levee section is often based on the properties of the poorest material that must be used
