Design Concepts In Nutritional Epidemiology:

Design Concepts in Nutritional Epidemiology Barrie M. Margetts, Michael Nelson, 1997-04-24 In examining the relationship between nutritional exposure and disease aetiology the importance of a carefully considered experimental design cannot be overstated A sound experimental design involves the formulation of a clear research hypothesis and the identification of appropriate measures of exposure and outcome It is essential that these variables can be measured with a minimum of error whilst taking into account the effects of chance and bias and being aware of the risk of confounding variables The first edition of Design Concepts in Nutritional Epidemiology presented a thorough guide to research methods in nutritional epidemiology Since publication of the 1st edition we now have a much better understanding of the characteristics of nutritional exposure that need to be measured in order to answer questions about diet disease relationships The 2nd edition has been extensively revised to include the most up to date methods of researching this relationship Included are new chapters on qualitative and sociological measures anthropometric measures gene nutrient interactions and cross sectional studies Design Concepts in Nutritional Epidemiology will be an essential text for nutritionists and epidemiologists helping them in their quest to improve the quality of information upon which important public health decisions are made
