Structural Concrete M. Nadim Hassoun, Akthem Al-Manaseer, 2005-03-01 Emphasizing a conceptual understanding of concrete design and analysis Structural Concrete Third Edition builds the students understanding by presenting design methods in an easy to understand manner supported with the use of numerous examples and problems Updated for the latest ACI 318 05 code this new Third Edition includes up to date coverage of seismic design including IBC 2003 references and new methods for predicting shear and creep in concrete based on the authors own research over the past ten years which will be reflected in the forthcoming ACI 209 code Fibre-reinforced concrete: From design to structural applications FIB - Féd. Int. du Béton, 2016 The FRC 2014 Workshop Fibre Reinforced Concrete from Design to Structural Applications was the first ACI fib joint technical event The Workshop held at Polytechnique Montreal Canada on July 24th and 25th 2014 was attended by 116 participants from 25 countries and 4 continents The first international FRC workshop was held in Bergamo Italy in 2004 At that time the lack of specific building codes and standards was identified as the main inhibitor to the application of this technology in engineering practice Ten years after Bergamo many of the objectives identified at that time have been achieved The use of fibre reinforced concrete FRC for designing structural members in bending and shear has recently been addressed in the fib Model Code 2010 Steel fibre reinforced concrete SFRC has also been used structurally in several building and bridge projects in Europe and North America SFRC has been widely used in segmental tunnel linings all over the world Members of ACI 544 and fib TG 4.1 have been involved in writing code based specifications for the design of FRC structural members More than fifty papers were presented at the Workshop from which forty four were selected for this joint ACI fib publication The papers are organised in the document under six themes Design guidelines and specifications Material properties for design Behaviour and design of beams and columns Behaviour and design of slabs and other structures Behaviour and design of foundations and underground components and finally Applications in structure and underground construction projects **Structural Concrete** M. Nadim Hassoun, 1998 Structural Concrete Theory and Design is a comprehensive new textbook that fills the gap between industrial and educational requirements by helping students understand the practical aspects of the modern design of concrete structures M Nadim Hassoun presents the analysis and design of both reinforced and prestressed concrete elements in an exceptionally logical and easy to read manner Written to cover a two course sequence on the design of reinforced concrete structures this book should also serve as a valuable reference for the practicing engineer and those interested in concrete materials and design **Examples for the Design of Structural Concrete with Strut-and-tie Models** American Concrete Institute. Convention, American Concrete Institute. Subcommittee 445-1, Strut and Tie Models, 2002 Prepared by members of ACI Subcommittee 445.1 Strut and Tie Models for sessions at the Fall Convention in Phoenix October 27 to November 1 2002 and sponsored by Joint ACI ASCE Committee 445 Shear and Torsion and ACI Committee 318 E Shear and Torsion **Fibre Reinforced Concrete: From**

**Design to Structural Applications** FIB - International Federation for Structural Concrete, 2020-08-01 The first international FRC workshop supported by RILEM and ACI was held in Bergamo Italy in 2004 At that time a lack of specific building codes and standards was identified as the main inhibitor to the application of this technology in engineering practice The workshop aim was placed on the identification of applications guidelines and research needs in order for this advanced technology to be transferred to professional practice The second international FRC workshop held in Montreal Canada in 2014 was the first ACI fib joint technical event Many of the objectives identified in 2004 had been achieved by various groups of researchers who shared a common interest in extending the application of FRC materials into the realm of structural engineering and design The aim of the workshop was to provide the State of the Art on the recent progress that had been made in term of specifications and actual applications for buildings underground structures and bridge projects worldwide The rapid development of codes the introduction of new materials and the growing interest of the construction industry suggested presenting this forum at closer intervals In this context the third international FRC workshop was held in Desenzano Italy four years after Montreal In this first ACI fib RILEM joint technical event the maturity gained through the recent technological developments and large scale applications were used to show the acceptability of the concrete design using various fibre compositions The growing interests of civil infrastructure owners in ultra high performance fibre reinforced concrete UHPFRC and synthetic fibres in structural applications bring new challenges in terms of concrete technology and design recommendations In such a short period of time we have witnessed the proliferation of the use of fibres as structural reinforcement in various applications such as industrial floors elevated slabs precast tunnel lining sections foundations as well as bridge decks We are now moving towards addressing many durability based design requirements by the use of fibres as well as the general serviceability based design However the possibility of having a residual tensile strength after cracking of the concrete matrix requires a new conceptual approach for a proper design of FRC structural elements With such a perspective in mind the aim of FRC2018 workshop was to provide the State of the Art on the recent progress in terms of specifications development actual applications and to expose users and researchers to the challenges in the design and construction of a wide variety of structural applications Considering that at the time of the first workshop in 2004 no structural codes were available on FRC we have to recognize the enormous work done by researchers all over the world who have presented at many FRC events and convinced code bodies to include FRC among the reliable alternatives for structural applications This will allow engineers to increasingly utilize FRC with confidence for designing safe and durable structures Many presentations also clearly showed that FRC is a promising material for efficient rehabilitation of existing infrastructure in a broad spectrum of repair applications These cases range from sustained gravity loads to harsh environmental conditions and seismic applications which are some of the broadest ranges of applications in Civil Engineering The workshop was attended by researchers designers owner and government representatives as well as

participants from the construction and fibre industries The presence of people with different expertise provided a unique opportunity to share knowledge and promote collaborative efforts These interactions are essential for the common goal of making better and sustainable constructions in the near future The workshop was attended by about 150 participants coming from 30 countries Researchers from all the continents participated in the workshop including 24 Ph D students who brought their enthusiasm in FRC structural applications For this reason the workshop Co chairs sincerely thank all the enterprises that sponsored this event They also extend their appreciation for the support provided by the industry over the last 30 years which allowed research centers to study FRC materials and their properties and develop applications to making its use more routine and accepted throughout the world Their important contribution has been essential for moving the knowledge base forward Finally we appreciate the enormous support received from all three sponsoring organizations of ACI fib and Rilem and look forward to paving the path for future collaborations in various areas of common interest so that the developmental work and implementation of new specifications and design procedures can be expedited internationally

**Practical design of structural concrete** FIB - International Federation for Structural Concrete,1999-09-01

**Ultimate Limit-state Design of Concrete Structures** M. D. Kotsovos,M. Pavlovic,1999 Structural concrete members often show great deviation in structural performance from that predicted by the current code of practice In certain cases the predications considerably underestimate the capabilities of a structure or member while in others the predictions are unsafe as they overestimate the member s ability to perform in a prescribed manner Clearly a rational and unified design methodology is still lacking for structural concrete This book presents a simplified methodology based on calculations which are quick easily programmable and no more complex than those required by the current codes It involves identifying the regions of a structural member or structure through which the external load is transmitted from its point of application to the supports and then strengthening these regions as required As most of these regions enclose the trajectories of internal compression actions the technique has been called the compressive force path method Ultimate limit state design for concrete structures will provide designers with a practical and easily applied method for the design of a concrete structure which is fully compatible with the behaviour of concrete as described by valid experimental evidence at both the material and structural level

Design Examples - Design Examples for the 1996 FIP Recommendations 'Practical Design of Structural Concrete' fib Fédération internationale du béton,2002-01-01 The 1996 FIP Recommendations Practical Design of Structural Concrete were finally published by SETO in September 1999 They had been developed based on the 1990 CEB FIP Model Code The main objective of this Bulletin is now to demonstrate by practical examples the application of these recommendations and especially to illustrate the use of strut and tie models for designing discontinuity regions in concrete structures These examples represent also a continuation of the 1990 FIP Handbook on Practical Design that had been based on the former 1984 version of the recommendations Most of the examples are recently built existing structures Although some of them may be considered as quite important the chosen examples are by no means exceptional The technical report does not deal with the discussion of aesthetic or general conceptual aspects On the contrary the main aim is to treat particular design aspects by selecting local regions of the chosen structures that are then designed and detailed following the design principles and specifications proposed in the 1996 FIP Recommendations mentioned above The document is believed to be of interest to all engaged in the design of structural concrete It hopefully supports the use of more consistent design and detailing tools like strut and tie models *Simplified Shear Design of Structural Concrete Members* ,2005 This document contains the appendixes to NCHRP report 549 Simplified shear design of structural concrete members Provided by publisher *Design Examples for Strut-and-tie Models* fib Fédération internationale du béton,2011 fib Bulletin 61 is a continuation of fib Bulletin 16 2002 Again the bulletin s main objective is to demonstrate the application of the FIP Recommendations Practical Design of Structural Concrete and especially to illustrate the use of strut and tie models to design discontinuity regions D regions in concrete structures Bulletin 61 presents 14 examples most of which are existing structures built in recent years Although some of the presented structures can be considered to be quite important and in some instances complex the chosen examples are not intended to be exceptional The main aim is to look at specific design aspects by selecting D regions of the presented structures that are designed and detailed according to the proposed design principles and specifications for the use of strut and tie models Two papers at the end of the bulletin deal with the role of concrete tension fields in modelling with strut and tie models and summarize the experiences gained by the Working Group in applying strut and tie models to the examples in the bulletin It is hoped that fib Bulletin 61 will be of interest to engineers involved in the design of concrete

structures supporting the use of more consistent design and detailing tools such as strut and tie models      **Structural Concrete, Volume 2** fib Fédération internationale du béton, 2010-01-01

The second edition of the Structural Concrete Textbook is an extensive revision that reflects advances in knowledge and technology over the past decade. It was prepared in the intermediate period from the CEP FIP Model Code 1990 MC90 to fib Model Code 2010 MC2010 and as such incorporates a significant amount of information that has been already finalized for MC2010 while keeping some material from MC90 that was not yet modified considerably. The objective of the Textbook is to give detailed information on a wide range of concrete engineering from selection of appropriate structural system and also materials through design and execution and finally behaviour in use. The revised fib Structural Concrete Textbook covers the following main topics: phases of design process, conceptual design, short and long term properties of conventional concrete including creep, shrinkage, fatigue and temperature influences, special types of concretes such as self-compacting concrete, architectural concrete, fibre-reinforced concrete, high and ultra-high performance concrete, properties of reinforcing and prestressing materials, bond, tension stiffening, moment-curvature, confining effect, dowel action, aggregate interlock, structural analysis with or without time-dependent effects, definition of limit states, control of cracking and deformations, design for moment, shear or torsion, buckling, fatigue, anchorages, splices, detailing, design for durability including service life, design aspects, deterioration mechanisms, modelling of deterioration mechanisms, environmental influences, influences of design and execution on durability, fire design including changes in material and structural properties, spalling, degree of deterioration, member design, linear members and slabs with reinforcement layout, deep beams, management, assessment, maintenance, repair including conservation strategies, risk management, types of interventions as well as aspects of execution, quality assurance, formwork and curing. The updated Textbook provides the basics of material and structural behaviour and the fundamental knowledge needed for the design, assessment or retrofitting of concrete structures. It will be essential reading material for graduate students in the field of structural concrete and also assist designers and consultants in understanding the background to the rules they apply in their practice. Furthermore, it should prove particularly valuable to users of the new editions of Eurocode 2 for concrete buildings, bridges and container structures which are based only partly on MC90 and partly on more recent knowledge which was not included in the 1999 edition of the Textbook.
