EHCI Engineering for Human Computer Interaction is a conference organized by the IFIP 2.7.13.4 working group started in 1974 and held every three years since 1989. The group's activity is the scientific investigation of the relationships among the human factors in computing and software engineering. DSVIS Design Specification and Verification of Interactive Systems is an annual conference started in 1994 and dedicated to the use of formal methods for the design of interactive systems. Of course these two research domains have a lot in common and are informed by each other's results. The year 2004 was a good opportunity to bring closer these two research communities for an event: the 11th edition of DSVIS and the 9th edition of EHCI. EHCI DSVIS was set up as a working conference bringing together researchers and practitioners interested in strengthening the scientific foundations of user interface design, specification and verification and in examining the relationships between software engineering and human computer interaction. The call for papers attracted a lot of attention and we received a record number of submissions: out of the 65 submissions, 23 full papers were accepted, which gives an acceptance rate of approximately 34%. Three short papers were also included. The contributions were categorized in 8 chapters. Chapter 1 Usability and Software Architecture contains three contributions which advance the state of the art in usability approaches for modern software engineering.

Timbre: Acoustics, Perception, and Cognition Kai Siedenburg, Charalampos Saitis, Stephen McAdams, Arthur N. Popper, Richard R. Fay, 2019-05-07

Roughly defined as any property other than pitch, duration and loudness that allows two sounds to be distinguished, timbre is a foundational aspect of hearing. The remarkable ability of humans to recognize sound sources and events, e.g. glass breaking, a friend's voice, a tone from a piano, stems primarily from a capacity to perceive and process differences in the timbre of sounds. Timbre raises many important issues in psychology and the cognitive sciences: musical acoustics, speech processing, medical engineering and artificial intelligence. Current research on timbre perception unfolds along three main fronts. On the one hand, researchers explore the principal perceptual processes that orchestrate timbre processing, such as the structure of its perceptual representation, sound categorization and recognition, memory for timbre and its ability to elicit rich semantic associations, as well as the underlying neural mechanisms. On the other hand, timbre is studied as part of specific scenarios including the perception of the human voice as a structuring force in music, as perceived with cochlear implants and through its role in affecting sound quality and sound design. Finally, computational acoustic models are sought through prediction of psychophysical data, physiologically inspired representations and audio analysis/synthesis techniques. Along these three scientific fronts, significant breakthroughs have been achieved during the last decade. This volume will be the first book dedicated to a comprehensive and authoritative presentation of timbre perception and cognition research and the acoustic modeling of timbre. The volume will serve as a natural complement to the SHAR volumes on the basic auditory parameters of Pitch, edited by Plack, Oxenham, Popper and Fay, and Loudness, by Florentine, Popper and Fay. Moreover, through the integration of complementary scientific methods ranging from signal processing to brain imaging, the book has the potential

to leverage new interdisciplinary synergies in hearing science For these reasons the volume will be exceptionally valuable to various subfields of hearing science including cognitive auditory neuroscience psychoacoustics music perception and cognition but may even exert significant influence on fields such as musical acoustics music information retrieval and acoustic signal processing It is expected that the volume will have broad appeal to psychologists neuroscientists and acousticians involved in research on auditory perception and cognition Specifically this book will have a strong impact on hearing researchers with interest in timbre and will serve as the key publication and up to date reference on timbre for graduate students postdoctoral researchers as well as established scholars

Designing in Dark Times Virginia Tassinari, Eduardo Staszowski, 2020-11-12 The architectural historian and critic Kenneth Frampton never recovered from the force of Hannah Arendt's teaching at The New School in New York The philosopher Richard J Bernstein considers her the most perceptive political theorist and observer of dark times a concept which drawing from Brecht she made her own Building on the revival of interest in Hannah Arendt and on the increasing turn in design towards the expanded field of the social this unique book uses insights and quotations drawn from Arendt's major writings *The Human Condition* *The Origins of Totalitarianism* *Men in Dark Times* to assemble a new kind of lexicon for politics designing and acting today Taking 56 terms from *Action Beginnings* and *Creativity through Mortality* *Nativity* and *Play to Superfluity* *Technology and Violence* and inviting designers and scholars of design world wide to contribute *Designing in Dark Times* An Arendtian Lexicon offers up an extraordinary range of short essays that use moments and quotations from Arendt's thought as the starting points for reflection on how these terms can be conceived for contemporary design and political praxis Neither simply dictionary nor glossary the lexicon brings together designing and political philosophy to begin to create a new language for acting and designing against dark times
