Contributions To The Calculus 19381941:

Contributions to the Calculus of Variations. 1938-1941 Caroll Parker Brady, Edward Alfred Nordhaus, Augusto Bobonis, Ellen Clayton Stokes, Aubrey Wilfred Landers, Marry Kenny Landers, Katharine Elizabeth Hazard, Joseph Harmon Levin, Raph Mansfield, Albert B.. Carson, 1942 *Contributions to the Calculus of Variations* University of Chicago. Department of Mathematics, 1931 Control Theory and the Calculus of Variations A. V. Balakrishnan, 1969 Quadratic variational theory Stochastic functional equations continuity properties and relation to ordinary equations Partial regularity theorems for elliptic systems Strengthening caratheodory s method to apply in control problems Optimal control problems as mathematical programming in an unorthodox function space Controlled diffusions under polynomial growth conditions Separation and support properties of convex sets a survey Some non classical variational problems arising from optimal filter problems A new existence theorem in the class of piecewise continuous control functions The epsilon technique a constructive approach to optimal control Lagrange multipliers re visited *Lectures on the Calculus of Variations* Gilbert Ames Bliss, 1963 The Differential Geometry of Finsler Spaces Hanno Rund, 2012-12-06 The present monograph is motivated by two distinct aims Firstly an endeavour has been made to furnish a reasonably comprehensive account of the theory of Finsler spaces based on the methods of classical differential geometry Secondly it is hoped that this monograph may serve also as an introduction to a branch of differential geometry which is closely related to various topics in theoretical physics notably analytical dynamics and geometrical optics With this second object in mind an attempt has been made to describe the basic aspects of the theory in some detail even at the expense of conciseness while in the more specialised sections of the later chapters which might be of interest chiefly to the specialist a more succinct style has been adopted The fact that there exist several fundamentally different points of view with regard to Finsler geometry has rendered the task of writing a coherent account a rather difficult one This remark is relevant not only to the development of the subject on the basis of the tensor calculus but is applicable in an even wider sense The extensive work of H BUSEMANN has opened up new avenues of approach to Finsler geometry which are independent of the methods of classical tensor analysis In the latter sense therefore a full description of this approach does not fall within the scope of this treatise although its fundamental significance cannot be doubted **The Interaction of Analysis and Geometry** Victor I. Burenkov, Tadeusz Iwaniec, Sergei Konstantinovich Vodop'ia nov, 2007 Based on talks given at the International Conference on Analysis and Geometry in honor of the 75th birthday of Yurii Reshetnyak Novosibirsk 2004 this title includes topics such as geometry of spaces with bounded curvature in the sense of Alexandrov quasiconformal mappings and mappings with bounded distortion and nonlinear potential theory **Constrained Extrema Introduction to the Differentiable Case with Economic Applications** M.A. El-Hodiri, 2012-12-06 These notes are the result of an interrupted sequence of seminars on optimization theory with economic applications starting in 1964 1965 This is mentioned by way of explaining the uneven style that pervades them

Lately I have been using the notes for a two semester course on the subject for graduate students in economics Except for the introductory survey the notes are intended to provide an appetizer to more sophisticated aspects of optimization theory and economic theory The notes are divided into three parts Part I collects most of the results on constrained extremf of differentiable functionals on finite and not so finite dimensional spaces It is to be used as a reference and as a place to find credits to various authors whose ideas we report Part II is concerned with finite dimensional problems and is written in detail Needless to say my contributions are marginal The economic examples are well known and are presented by way of illustrating the theory Part III is devoted to variational problems leading to a discussion of some optimal control problems There is a vast amount of literature on these problems and I tried to limit my intrusions to explaining some of the obvious steps that are usually left out I have borrowed heavily from Akhiezer 1 Berkovitz 7 Bliss IOJ and Pars 40J The economic applications represent some of my work and are presented in the spirit of illustration

Quadratic Form Theory and Differential Equations, 1981-03-10 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory ant its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering

Proceedings of the IUTAM Symposium on Finite Elasticity Donald E. Carlson, R.T. Shield, 2012-12-06 Although finite elasticity theory has its roots in the nineteenth century its development was largely neglected until the end of the Second World War Since then it has attracted a substantial amount of attention and considerable progress has been made both in our understanding of the basis of the subject and in its applications It occurred to me about three years ago that finite elasticity had reached a level of development at which an international symposium on the subject was overdue Accordingly with strong encouragement from Professor P M Naghdi and numerous other colleagues I submitted to the International Union of Theoretical and Applied Mechanics a proposal for their support of such a symposium to be held at Lehigh University during the period August 10 15 1980 The proposal received enthusiastic support from the International Union and an international scientific committee under my chairmanship consisting of Professors G

Fichera Rome W T Koiter Delft L I Sedov Moscow and A J M Spencer Nottingham was assigned responsibility for the scientific program In constructing the program we aimed at as broad a coverage as possible of the many aspects of the subject on which significant progress is currently being made These range from theoretical studies of existence and uniqueness of solutions of the governing equations of finite elasticity theory to experimental studies of its application to such problems as tear resistance and friction in vulcanized rubbers

The New Era in American Mathematics, 1920-1950

Karen Hunger Parshall, 2022-02-22 The 1920s witnessed the birth of a serious mathematical research community in America Prior to this mathematical research was dominated by scholars based in Europe but World War I had made the importance of scientific and technological development clear to the American research community resulting in the establishment of new scientific initiatives and infrastructure Physics and chemistry were the beneficiaries of this renewed scientific focus but the mathematical community also benefitted and over time began to flourish Over the course of the next two decades despite significant obstacles this constellation of mathematical researchers programs and government infrastructure would become one of the strongest in the world In this meticulously researched book Karen Parshall documents the uncertain but ultimately successful rise of American mathematics during this time Drawing on research carried out in archives around the country and around the world as well as on the secondary literature she reveals how geopolitical circumstances shifted the course of international mathematics She provides surveys of the mathematical research landscape in the 1920s 30s and 40s introduces the key players and institutions in mathematics at that time and documents the effect of the Great Depression and the second world war on the international mathematical community The result is a comprehensive account of the shift of mathematics center of gravity to the American stage

Smooth Functions Mohamed A. El-Hodiri, 2012-12-06 It is not an exaggeration to state that most problems dealt with in economic theory can be formulated as problems in optimization theory This holds true for the paradigm of behavioral optimization in the pursuit of individual self interests and societally efficient resource allocation as well as for equilibrium paradigms where existence and stability problems in dynamics can often be stated as potential problems in optimization For this reason books in mathematical economics and in mathematics for economists devote considerable attention to optimization theory However with very few exceptions the reader who is interested in further study is left with the impression that there is no further place to go to and that what is in these second hand sources is all these is available as far as the subject of optimization theory is concerned On the other hand the main results from mathematics are often carelessly stated or more often than not they do not get to be formally stated at all Furthermore it should be well understood that economic theory in general and mathematical economics in particular must be classified as special types of applied mathematics or more precisely of motivated mathematics since tools of mathematical analysis are used to prove theorems in an economics context in the manner in which probability theory may be classified Hence rigor and correct scholarship are of
