## **Control Of Eye Movements:**

**The Control of Eye Movements** Paul Bach-y-Rita, 2012-12-02 The Control of Eye Movements presents the proceedings of the Symposium on the Control of Eye Movements organized by the Smith Kettlewell Institute of Visual Sciences of the Pacific Medical Center and the Department of Visual Sciences of the University of the Pacific Graduate School of Medical Sciences San Francisco California November 10 11 1969 The book is organized into two parts Part I is devoted to presentations of anatomical physiological pharmacological psychological and clinical aspects of eye movements The material presented should provide a valuable reference source as well as increase awareness of the need for further investigation of many aspects of the basic physiology of eye movements Part II presents a series of papers dealing with models of various parts of the oculomotor system The modeling approach to control of eye movements is still in its infancy and the present work presents the first comprehensive survey of biophysical mathematical and engineering aspects of eye movement control

**Models of Oculomotor Behavior & Control** Bert L. Zuber, 1981-11-12 *Neuro-Ophthalmology* A. Straube, U. Büttner, F. Bandello, 2007-07 All motor behavior is characterized by sensory inputs causing specific motor reactions Because humans modify motor reactions voluntarily or through experience this input output relation is more complex in humans than in lower vertebrates Eye movements provide a window on fundamental brain function not only for topographic diagnosis of dysfunctions but also for the comprehension of normal brain function This book highlights basic mechanical properties of eye movements explains the neuronal basis of the vestibular ocular reflex saccadic eye movements smooth pursuit eye movements and vergence eye movements and deals with their pharmacological manipulation in disorders Since precise measurement of motor reactions is essential for understanding the oculomotor system one chapter critically discusses current registration methods and another one considers the possibilities and limitations of modeling it by control theory methods Its comprehensive characterization of eye movements and their relation to brain function makes this publication essential reading to ophthalmologists neurologists and clinical neuropsychologists *The Control of eye movements* Paul Bach-y-Rita, Carter C. **Movements** Roger PG van Gompel,2007-03-27 Eye movement recording has become the method of choice in a wide variety of disciplines investigating how the mind and brain work This volume brings together recent high quality eye movement research from many different disciplines and in doing so presents a comprehensive overview of the state of the art in eye movement research Sections include the history of eye movement research physiological and clinical studies of eye movements transsaccadic integration computational modelling of eye movements reading spoken language processing attention and scene perception and eye movements in natural environments Includes recent research from a variety of disciplines Divided into sections based on topic areas with an overview chapter beginning each section Through the study of eye movements we can learn about the human mind and eye movement recording has become the method of choice in many disciplines The Oxford Handbook of Eye Movements Simon Liversedge,Iain Gilchrist,Stefan Everling,2011-08-18 In the past few years there has been an explosion of eye movement research in cognitive science and neuroscience The Oxford Handbook of Eye Movements provides the first comprehensive review of the entire field of eye movement research This book is the definitive reference work in this field **Visual and Control Aspects of Saccadic Eye Movements** Laurence R.

Young,Bert L. Zuber,Lawrence Stark,1966 The research related in this report represents part of a continuing effort to study the physiology of the visual system in man using the experimental and analytic techniques of control engineering Recent reports have dealt with the dynamics of the vergence and version tracking loops emphasizing the intermittent characteristics of the latter and some consideration of intraocular pressure regulation This report consists of two studies related to saccadic eye movements those rapid conjugate eye movements which jump the eyes about voluntarily and involuntarily These saccades form the position correcting loop for visual tracking to keep the eyes on target Part one of the report by Dr L R Young investigates the control aspects of saccades considering the information used the feedback available and the observed mechanical dynamic performance of this fast slewing control Some new experimental results on the saccadic dead zone lead to a simple statistical theory for the time of occurrence of small corrective eye movements The question of eye movement proprioception is discussed and a variety of saccadic control models are critically reviewed Part two of the report by Drs B L Zuber and L Stark concentrates on the information acquisition associated with eye movements rather than the mechanical characteristics The miniature involuntary eye movements occurring during fixation are reexamined from the point of view of their effect on visual acuity Results are presented on saccadic suppression or the elevation of visual acuity thresholds associated with microsaccades and voluntary saccadic movements Considered together with suppression of vision during the fast phase of vestibular nystagmus and pupillary response suppression during saccades these results bear directly on overall models of information processing in the visual control system Preface Eye Movement Research J.M. **in Humans** Bert Louis Zuber, 1965 *Models of Horizontal Eye Movements, Part I* John Enderle, 2010-10-10 There are five different types of eye movements saccades smooth pursuit vestibular ocular eye movements optokinetic eye movements and vergence eye movements The purpose of this book is focused primarily on mathematical models of the horizontal saccadic eye movement system and the smooth pursuit system rather than on how visual information is processed A saccade is a fast eye movement used to acquire a target by placing the image of the target on the fovea Smooth pursuit is a slow eye movement used to track a target as it moves by keeping the target on the fovea The vestibular ocular movement is used to keep the eyes on a target during brief head movements The optokinetic eye movement is a combination of saccadic and slow eye movements that keeps a full field image stable on the retina during sustained head rotation Each of these movements is a conjugate eye movement that is movements of both eyes together driven by a common neural source A vergence movement is a non conjugate eye movement allowing the eyes to track targets as they come closer or farther away In this book early models of saccades and smooth pursuit are presented The smooth pursuit system allows tracking of a slow moving target to maintain its position on the fovea Models of the smooth pursuit have been developed using systems control theory all involving a negative feedback control system that includes a time delay controller and plant in the forward loop with unity feedback The oculomotor plant and saccade generator are the basic elements of the saccadic system The oculomotor plant consists of three muscle pairs and the eyeball A number of oculomotor plant models are described here beginning with the Westheimer model published in 1954 and up through our 1995 model involving a 4th order oculomotor plant model The work presented here is not an exhaustive coverage of the field but focused on the interests of the author In Part II a state of art model of the saccade system is presented including a neural network that controls the system Table of Contents Introduction Smooth Pursuit Models Early Models of the Horizontal Saccadic Eye Movement System Velocity and Acceleration Estimation
