Cancer And Aging:

Cancer and Aging Martine Extermann, 2013 Outlining the complex interaction between the two phenomena Cancer is clearly an age related disease Recent research in both aging and cancer has demonstrated the complex interaction between the two phenomena This affects a wide spectrum of research and practice anywhere from basic research to health care organization Core examples of these close associations are addressed in this book Starting with basic research the first chapters cover cancer development mTOR inhibition senescent cells altering the tumor microenvironment and immune senescence affecting cancer vaccine response Taking into account the multidisciplinary of geriatric oncology several chapters focus on geriatric and oncologic aspects in patient assessment treatment options nursing and exercise programs The book is rounded off by a discussion on the impact of the metabolic syndrome illustrating the interactions between comorbidity and cancer and a chapter on frailty This book provides the reader with insights that will hopefully foster his or her reflection in their own research and practice to further the development of this most exciting field Given the aging of the population worldwide and the high prevalence of cancer it is essential reading not only for oncologists and geriatricians but for all health practitioners

Cancer and Aging Handbook Keith M. Bellizzi, Margot Gosney, 2012-07-20 A state of the art multidisciplinary approach to cancer and aging With the majority of cancers occurring in individuals over the age of 65 against a backdrop of an expanding aging population there is an urgent need to integrate the areas of clinical oncology and geriatric care This timely work tackles these issues head on presenting a truly multidisciplinary and international perspective on cancer and aging from world renowned experts in geriatrics oncology behavioral science psychology gerontology and public health Unlike other books on geriatric oncology that focus mainly on treatment Cancer and Aging Handbook Research and Practice examines all phases of the cancer care continuum from prevention through evidence based diagnosis and treatment to end of life care Detailed clinical and research information helps guide readers on effective patient care as well as caregiver training research and intervention Coverage includes Epidemiology of cancer in older adults plus the unique physical mental and social issues involved Strategies and guidelines for prevention screening and treatment of older individuals with cancer The most common cancers in the elderly including breast colorectal lung prostate and ovarian cancer Cancer survivorship in older adults as well as the all critical issues of palliative care and pain management Emerging topics such as caregiver and family issues different models of care and cost considerations An essential resource for clinicians and caregivers as well as researchers interested in this evolving field Cancer and Aging Handbook is also useful for public health professionals and policymakers who need to formulate services and allocate resources for the growing population of older cancer patients

Aging and Cancer F. F. Holmes, 2012-12-06 The life of a human being is finite and all humans age see Fries 1980 It is difficult to separate the effects of disease on organs and tissues from those expected of aging This is particularly true for vascular and degenerative processes for which there are no clear boundaries between aging and disease

Morbidity and mortality from heart disease and stroke are probably due both to disease and to changes of aging. For cancer, the second leading cause of death in America, the situation is quite different: cancer is clearly a disease and is not a change expected with aging. Cancer incidence increases almost logarithmically after age 40. In the United States, about one half of all cases of cancer are diagnosed after age 65, although those over 65 comprise less than one eighth of the population. Thus, cancer is very much a disease of the elderly. There are at least two reasons for this: first, the prolonged exposure to cancer-inducing agents; and second, the waning power of immune defenses against cancer.

The Underlying Molecular, Cellular and Immunological Factors in Cancer and Aging Stringer Sue Yang, 2012-12-06

Background: Cancer is a variety of malignancies generally associated with aging. As the overall health technology and health care delivery improved with the advances made in medicine and science in the United States, the life expectancy of the population also increased. The average life expectancy in the U.S.A. has increased from 49 years at the end of 1900 to 75 years today. In 1990, 13% of the population of 65 years and older constituted 25.5 million or 11.3% of the total U.S. population. In 1980, 4% of the population of 65 years and older constituted 12.5% of the population according to the 1990 U.S. census. As cancer diagnosis and treatment have improved, cancer mortality among patients under 55 has been significantly reduced within recent years. However, cancer incidence under 55 is still increasing at about 0.4% per year as compared to 1.0% for all ages or 0.6% for

Cancer in the Lives of Older Americans Sarah H. Kagan, 2012-02-23

The oldest old individuals aged 85 and above are the most rapidly growing segment of American society. And although more than a third of cancer occurs in people over 75 years of age, their tumors are less fully diagnosed and often less fully treated than those in younger patients. Ageism may account for this discrepancy: why intervene if an older man or woman with cancer doesn't have long to live anyway? Yet older people often tolerate chemotherapy, surgery, and radiation as well as younger patients while continuing to maintain their quality of life for years to come. The lack of clinical trials among this age group results in a deficit of knowledge regarding how to treat cancer in older adults. Little has been written to guide clinicians, social scientists, families, and individuals.

Cancer in the Lives of Older Americans: Blessings and Battles Sarah H. Kagan writes from the perspective of more than twenty years of practice, inquiry, and education as a nurse. She uses anecdotes and case studies to illustrate important points about cancer among older adults. The book follows the story of Mrs. Eck, a woman in her 80s diagnosed with pancreatic cancer. Mrs. Eck's situation sets the stage for a discussion of cancer, which too often focuses on cells and drugs, diagnoses and prognoses without looking more closely at the people who experience the disease. Chapters offer varied assessments of what it means to be old and have cancer in our society as Kagan explores other real experiences of cancer for older adults alongside information that will prove essential to patients, their families, scholars, and clinicians.

Geriatric Oncology Martine Extermann, 2019 This book is intended as a comprehensive resource for clinicians and researchers seeking in depth information on geriatric oncology The coverage encompasses epidemiology the biology and pathophysiology of aging and cancer geriatric assessment and management hematologic malignancies solid tumors issues in patient care and research methods Since cancer is a disease of aging and people are living longer most cancer patients are now aged 70 and older Yet the more we age the more diverse we become in terms of our health biologic fitness and cancer behavior Typically however general oncology clinical trials address only a selected healthier and younger population of patients Geriatric oncology is the area of oncology that addresses these issues but while a wealth of knowledge has been accumulated information is often difficult to retrieve or insufficiently detailed The SpringerReference program in which this book is published offers an ideal format for overcoming these limitations since it combines thorough coverage with access to living editions constantly updated chapter by chapter via a dynamic peer review process ensuring that information remains current and pertinent

Inflammation, Aging and Cancer Mahin Khatami, 2018-01-17 This book was prepared as extension of author's accidental discoveries on experimental models of acute and chronic ocular inflammatory diseases that were established at the University of Pennsylvania in 1980's Analyses of original data suggest a series of first evidence for direct link between inflammation and developmental phases of immune dysfunction in multistep tumorigenesis and angiogenesis The only evidence presented on initial events for interactions and synergies between activated host and recruiting cells toward tumorigenesis Effective immunity was defined as balance between two highly regulated and biologically opposing arms Yin and Yang of acute inflammation an amazingly precise signal communications between immune and non immune systems requiring differential bioenergetics Unresolved inflammation is a common denominator mapping aging process and induction of mild moderate or severe immune disorders including cancers Our knowledge of the fascinating biology of immunity in health or chronic diseases is fragmentary chaotic and confusing particularly for cancer science Lack of progress in curing majority of chronic diseases or cancer is primarily due to the fact that scientists work on isolated molecules cells or topics that are funded and promoted by decision makers in medical cancer establishment Despite existence of over 25 million articles on cancer related topics cancer biology and cure remain mysteries to be solved After a century of cancer research

the failure rates of therapies for solid tumors are 90% 5 Current reductionist views on cancer science are irresponsible shut gun approaches and create chaos Outcomes are loss of millions of precious lives and economic drain to society Very little is known about initial events that disturb effective immunity whose function is to monitor and arrest growth of cancerous cells or defend against other external or internal hazardous agents that threaten body's survival The author demonstrates the serious need for systematic understanding of how immune disruptors and aging process would alter effective immunity Outcomes of proposed orderly studies are expected to provide logical foundations for cost effective strategies to promote immunity toward a healthier society The policy makers and medical cancer establishment are urged to return to the common sense that our Forefathers used to serve the public

Biology of Aging Alvaro Macieira-Coelho,2012-12-06 The survival of the human species has improved significantly in modern times During the last century the mean survival of human populations in developed countries has increased more than during the preceding 5000 years This improvement in survival was accompanied by an increase in the number of active years In other words the increase in mean life span was accompanied by an increase in health span This is now accentuated by progress in medicine reducing the impact of physiologic events such as menopause and of pathologic processes such as atherosclerosis Up to now research on aging whether theoretical or experimental has not contributed to improvement in human survival Actually there is a striking contrast between these significant modifications in survival and the present knowledge of the mechanisms of human aging Revealed by this state of affairs are the profound disagreements between gerontologists in regard to the way of looking at the aging process The definition of aging itself is difficult to begin with because of the variability of how it occurs in different organisms
