Cancer Biology and Biosynthesis Samuel H. Wilson, 1991-01-25 This volume honors Mahlon Hoagland an eminent biochemist and is composed of reviews prepared by a number of his former students The volume will be of interest to molecular biologists and biochemists Research Awards Index ,1976 Research Grants Index National Institutes of Health (U.S.). Division of Research Grants, 1971 Translation and Its Regulation in Cancer Biology and Medicine Armen Parsyan, 2014-10-13 This book for the first time comprehensively assembles and analyzes a large body of information on the role of the fundamental mechanism of the protein biosynthesis pathway translation in cancer biology It systematically explores the function of the translation machinery and its regulation including cell signaling in the development maintenance and progression of human cancer The work presented here unveils the tremendous potential and applications of this vast and exciting branch of genetic biochemical and molecular science in cancer medicine and drug development Chapters contributed by experts in the field take the reader on a journey that starts with a dissection of the translation machinery and its regulation in norm and cancer Later chapters characterize etiological and pathogenetic roles that translation plays in specific cancer types Various aspects of diagnostic prognostic and therapeutic significance of the translation machinery and its control in cancer are discussed Readers will discover the importance of the process of translation and its regulatory mechanisms in physiology and cancer biology The chapters and the numerous illustrations included here were contributed by expert scientists and clinicians from renowned academic and clinical establishments in Canada the United States of America the United Kingdom Italy France Belgium Spain Germany and Australia The book conveys information and knowledge that may interest a broad range of students and scholars ranging from basic scientists to clinicians and drug developers seeking to better understand the protein synthesis and its aberrations in cancer biology and cancer medicine **Current Research** on Cancer Virology Current Cancer Research Project Analysis Center (U.S.),1975 Biology of Tumors: Cellular Biology and Growth Frederick Becker, 1975 As was shown in the first two volumes of this series great strides have been made in identifying many of the agents or classes of substances responsible for carcinogenesis and in delineating their interactions with the cell Clearly the aim of such studies is that once identified these agents can be eliminated from the environment Yet despite these advances and the elimination of some important carcinogenic agents one major problem exists It is a constant monitor of all oncologic study and diminishes the importance of every experiment and of every clinical observation As we noted earlier that problem is our inability to define the malignant cell It is through studies of the fundamental biology of tumors that we seek this definition A vast amount of information has been gathered which describes what this cell does and to a lesser extent how it does it But the why evades us We have been unable to define the malignant cell save in broad terms by comparing it to its normal counterpart The major problem appears to be that the malignant cell does so much It is a chimera mystifyingly composed of normal activities and structures of phenotypic schizophrenia with embryonic fetal and

adult charac teristics and occasionally a hint of an unclassifiable capacity unique to malignant cells **Current Cancer** Research on Isolation, Synthesis, and Screening of Anticancer Agents International Cancer Research Data Bank, 1978 Cancer Biology and Therapeutics Joseph G.
