Real-time Image Upscaling with Commonly Available Resources Nathaniel Tovar (Graduate student),2021 Abstract With the rise of video streaming platforms the need to maximize image quality at the user end while minimizing the amount of data sent has never been higher Compression algorithms are already nearing the limit of their ability to improve thus the only way to significantly decrease the amount of data sent would be to decrease the image resolution on the transmitter side and upscale the image on the user side The difficulty of this lies in the fact that the users have vastly different resources available to perform said upscaling and normal upscaling does not yield sufficiently high quality images Deep learning has enabled the advent of image super resolution but such solutions take too long to be useful in real time applications Therefore I am proposing a deep learning network that can be run in real time on a single core of a 2 GHz CPU while providing better quality than normal interpolation
