**Cancer Immunology and Immunotherapy** Glenn Dranoff, 2011-04-11 The interplay between tumors and their immunologic microenvironment is complex difficult to decipher but its understanding is of seminal importance for the development of novel prognostic markers and therapeutic strategies The present review discusses tumor immune interactions in several human cancers that illustrate various aspects of this complexity and proposes an integrated scheme of the impact of local immune reactions on clinical outcome Current active immunotherapy trials have shown durable tumor regressions in a fraction of patients However clinical efficacy of current vaccines is limited possibly because tumors skew the immune system by means of myeloid derived suppressor cells inflammatory type 2 T cells and regulatory T cells Tregs all of which prevent the generation of effector cells To improve the clinical efficacy of cancer vaccines in patients with metastatic disease we need to design novel and improved strategies that can boost adaptive immunity to cancer help overcome Tregs and allow the breakdown of the immunosuppressive tumor microenvironment **Cancer Immunology** Nima

The Biomarkers, Mechanism, and Therapeutic Strategies of Cancer Immunotherapy Resistance

Mou Peng, Xin Jin, Yunliang Gao, Xiaoxin Ren, 2025-07-30. Over the decades, cancer immunotherapy has been a burgeoning science in medicine and an established pillar of therapeutic options for diverse cancer types. Leading the way to success is mainly the discovery and development of immune checkpoint inhibitors (ICIs) and chimeric antigen receptor (CAR) T cell-based therapies. Under immunotherapy, a portion of cancer patients enables to achieve a significant and durable remission with a longer survival time, particularly in those with lung cancer, melanoma, genitourinary cancer, etc. However, striking disparities still exist in the effectiveness of anticancer immunotherapy and cause a great challenge to select appropriate candidates. A large part of cancer patients presents limited or no response to immunotherapy, mainly attributable to immunotherapy resistance. Despite of great strides already made, the exact mechanism underlying immunotherapy resistance is still enigmatic. Immunotherapy resistance is extremely complex and involves voluminous aspects such as tumor intrinsic factors, aberrant expression of tumor antigens, alterations of signaling pathways, etc.; tumor extrinsic factors, local tumor microenvironment, etc.; and host-related factors, gender, age, etc. More efforts should be made to characterize the underlying mechanism and uncover robust targets for a better response rate.
