generative adversarial networks GANs have made significant progress on facilitating the content creation process By learning from the data these approaches produce appealing content creation and editing results Nevertheless it remains challenging for the GAN based methods to 1 provide a controllable creation editing process for the user and 2 learn from limited data for the content creation tasks In this thesis we investigate several solutions to address the above issues We first propose a multi modal image to image translation framework that learns from the unpaired data We then leverage the image to image translation approaches to model the professional workflow of a particular content creation task We also design a differentiable retrieval scheme to gain the controllability of the conditional image synthesis model Finally we propose a regularization term to learn the GAN models under the limited training data First of all we propose an Image to Image translation framework that can 1 produce one to many translation results and 2 learn from unpaired data across various image domains Specifically the model disentangles images into a domain invariant content space and a domain specific attribute space to enable one to many translation On the other hand a cross cycle consistency loss function is used to train the model with unpaired data Furthermore we design a mode seeking regularization term to increase the diversity of the generated images Second we construct a system capable of modeling the progressive workflow for a particular type of artwork By leveraging a series of image to image translation networks to learn the progressive creation steps our model enables both multi stage image generation and multi stage editing of an existing piece of art Moreover we design an optimization process to address the reconstruction issue in the editing scenario Third we develop a differentiable retrieval approach to select real image patches as the reference for the image synthesis task With our differentiable retrieval approach we can 1 make the entire pipeline retrieval and generation end to end trainable and 2 encourage the selection of mutually compatible patches for the same generated image Furthermore we design two auxiliary loss functions to facilitate the training of the retrieval function Finally we propose a regularization term to train the GAN models on limited data We theoretically and empirically show that our scheme 1 improves the generalization performance and stabilizes the learning dynamics of GAN models under limited training data and 2 complements the recent data augmentation solutions
