Forms of Becoming Alessandro Minelli, 2009 What comes first form or function Evolutionary developmental biology or evo devo answers this fundamental question by showing how evolution controls the development of organisms Alessandro Minelli takes an in depth and comprehensive look at the history and key issues of evo devo focusing on the innovative ways animal organisms evolve through competition and cooperation Minelli provides a complete overview of conceptual developments from the fierce nineteenth century debates between the French biologists Geoffroy and Cuvier who fought over questions of form versus function to modern theories of how genes dictate body formation The book s wide ranging topics include expression patterns of genes developmental bias the role of developmental genes and genetic determinism Drawing from diverse examples such

as the anatomy of butterflies giraffes Siamese twins and corals Minelli extends and reformulates important concepts from development evolution and the interplay between the two

Developmental Biology Lewis Wolpert, 2011-08-25 From a single cell a fertilized egg comes an elephant a fly or a human How does this astonishing feat happen How does the egg know what to become How does it divide into the different cells the separate tissues the brain the fingernail every tiniest detail of the growing foetus These are the questions that the field of developmental biology seeks to answer It is an area that is closely linked to genetics evolution and molecular biology The processes are deeply rooted in evolutionary history the information is held in genes whose vital timings in switching on and off is orchestrated by a host of proteins expressed by other genes Timing is of the essence Here the distinguished developmental biologist Lewis Wolpert gives a concise account of what we now know about development discussing the first vital steps of growth the patterning created by Hox genes and the development of form embryonic stem cells the timing of gene expression and its management chemical signalling and growth

Developmental Biology Russ Hodge, 2009 Examines the relationship among cells genes and the environment and of the obstacles and achievements of molecular biologists attempting to understand how to build a human body

Developmental Biology Werner Müller, 1996-12-13 No field of contemporary biomedical science has been more revolutionized by the techniques of molecular biology than developmental biology This is an outstanding concise introduction to developmental biology that takes a contemporary approach to describing the complex process that transforms an egg into an adult organism The book features exceptionally clear two color illustrations and is designed for use in both undergraduate and graduate level courses The book is especially noteworthy for its treatment of development in model organisms whose contributions to developmental biology were recognized in the 1995 Nobel Prize for physiology and medicine

Developmental Biology Ray Arters, Developmental biology stands as one of the most profound and fundamental disciplines in modern science seeking to understand how a single fertilized cell transforms into a complex multicellular organism with specialized tissues organs and intricate body plans This remarkable process which occurs in every generation of every sexually reproducing species represents one of nature s most extraordinary achievements in biological engineering and information processing The journey from fertilization to fully formed organism involves a precisely orchestrated sequence of cellular divisions migrations differentiations and deaths that must occur with extraordinary temporal and spatial precision A single misplaced cell division or mistimed gene expression event can result in developmental abnormalities or embryonic death highlighting the incredible complexity and coordination required for successful development Yet despite this complexity development proceeds with remarkable consistency producing individuals that are recognizably members of

their species while maintaining enough variation to drive evolutionary change The historical foundations of developmental biology trace back to ancient observations of chick embryos in eggs but the field truly began to flourish in the 19th century with the advent of improved microscopy and systematic embryological studies Early embryologists like Karl Ernst von Baer established fundamental principles such as the observation that embryos of different species often appear more similar to each other than to their adult forms a insight that later proved crucial for understanding evolutionary relationships

Evolutionary Developmental Biology ,2021-02-16 Evolutionary Developmental Biology Volume 141 focuses on recent research in evolutionary developmental biology the science studying how changes in development cause the variations that natural selection operate on Several new hypotheses and models are presented in this volume and these concern how homology may be properly delineated how neural crest and placode cells emerged and how they formed the skull and jaw and how plasticity and developmental symbiosis enable normal development to be regulated by environmental factors New models for homology New hypotheses for the generation of chordates New models for the roles of plasticity and symbionts in normal development **On Development** John Tyler Bonner,1974 On Development is as John Tyler Bonner says a book on ideas the ideas at stake in the contest to unravel the mechanisms of life This fluent discussion of developmental biology synthesizes decades of intensive progress in specialized areas of the science from the dramatic deciphering of the genetic code to detailed analyses of animal behavior patterns Placing these discoveries in an evolutionary context Bonner explores the continuities and the transitoriness of individual lives and individual forms He begins by discussing the ubiquity among organisms of developmental cycles and their universal properties including senescence and death He argues that the life cycle itself is an object of natural selection and shows how in any species it reflects the evolutionary tradeoff between energy requirements of the individual and reproductive efficiency of the species Although nucleic acids are thought to be the ultimate and fundamental source of genetic regulation Bonner points out that a massive amount of information required for normal development is not directly controlled by nuclear DNA during the life cycle Each life cycle is governed by some immediate instructions from the genes and by many gene initiated instructions that were given in previous life cycles and have accumulated in various parts of the fertilized egg All of these instructions taken together govern the development of a new organism Acknowledging the great value of reductionist theories in biology Bonner constructs his synthetic view of development without resorting to vitalist concepts or to hand waving explanations He draws examples and evidence from more than half a century of biological research from sources as diverse as Spemann and Spiegelman Certain organisms such as the cellular slime molds upon which Bonner himself has conducted a number of original experiments and the social insects provide crucial examples of dramatic evolutionary increments in biological complexity and offer insight into the control mechanisms that make such advances possible **Essays on Developmental Biology Part B** Paul Wassarman,2016-03-10 In 2016 Current Topics in Developmental Biology CTDB will celebrate its 50th or golden anniversary To commemorate the
