Dependable Computing for Critical Applications 2 John F. Meyer, Richard D. Schlichting, 2012-12-06 This volume contains the papers presented at the Second International Working Conference on Dependable Computing for Critical Applications sponsored by IFIP Working Group 10A and held in Tucson Arizona on February 18-20 1991. In keeping with the first such conference on this topic which took place at the University of California Santa Barbara in 1989, this meeting was likewise concerned with an important basic question: Can we rely on Computers? In more precise terms, it addressed various aspects of computer system dependability, a broad concept defined as the trustworthiness of computer service such that reliance can justifiably be placed on this service. Given that this term includes attributes such as reliability, availability, safety, and security, it is our hope that these papers will contribute to further integration of these ideas in the context of critical applications. The program consisted of 20 papers and three panel sessions. The papers were selected from a total of 61 submissions at a November 1990 meeting of the Program Committee in Ann Arbor, Michigan. We were very fortunate to have a broad spectrum of interests represented with papers in the final program coming from seven different countries representing work at universities, corporations, and government agencies. The process was greatly facilitated by the diligent work of the Program Committee and the quality of reviews provided by outside referees. In addition to the paper presentations, there were three panel sessions organized to examine particular topics in detail.

Dependable Computing for Critical Applications 4 Flaviu Cristian, Gerard LeLann, Teresa Lunt, 2012-12-06 This volume contains the

articles presented at the Fourth International IFIP Working Conference on Dependable Computing for Critical Applications held in San Diego California on January 4-6 1994. In keeping with the previous three conferences held in August 1989 at Santa Barbara USA in February 1991 at Tucson USA and in September 1992 at Mondello Italy the conference was concerned with an important basic question: can we rely on computer systems for critical applications? This conference like its predecessors addressed various aspects of dependability: a broad term defined as the degree of trust that may justifiably be placed in a system's reliability, availability, safety, security, and performance. Because of its broad scope a main goal was to contribute to a unified understanding and integration of these concepts. The Program Committee selected 21 papers for presentation from a total of 95 submissions at a September meeting in Menlo Park California. The resulting program represents a broad spectrum of interests with papers from universities, corporations, and government agencies in eight countries. The selection process was greatly facilitated by the diligent work of the program committee members for which we are most grateful. As a Working Conference the program was designed to promote the exchange of ideas by extensive discussions. All paper sessions ended with a 30 minute discussion period on the topics covered by the session. In addition three panel sessions have been organized.

Avizienis, Jean-Claude Laprie, 2012-12-06. The International Working Conference on Dependable Computing for Critical Applications was the first conference organized by IFIP Working Group 10.4 Dependable Computing and Fault Tolerance in cooperation with the Technical Committee on Fault Tolerant Computing of the IEEE Computer Society and the Technical Committee 7 on Systems Reliability, Safety, and Security of EWICS. The rationale for the Working Conference is best expressed by the aims of WG 10.4: Increasingly individuals and organizations are developing or procuring sophisticated computing systems on whose services they need to place great reliance. In differing circumstances the focus will be on differing properties of such services: e.g. continuity, performance, real time response, ability to avoid catastrophic failures, prevention of deliberate privacy intrusions. The notion of dependability defined as that property of a computing system which allows reliance to be justifiably placed on the service it delivers, enables these various concerns to be subsumed within a single conceptual framework. Dependability thus includes as special cases such attributes as reliability, availability, safety, security. The Working Group is aimed at identifying and integrating approaches, methods, and techniques for specifying, designing, building, assessing, validating, operating, and maintaining computer systems which should exhibit some or all of these attributes. The concept of WG 10.4 was formulated during the IFIP Working Conference on Reliable Computing and Fault Tolerance on September 27-29 1979 in London, England, held in conjunction with the Europ IFIP 79 Conference.
