**Terrigenous Clastic Depositional Systems** W. E. Galloway, D. K. Hobday, 2012-12-06 The reserves or extractable fraction of the fuel mineral endowment are sufficient to supply the bulk of the world's energy requirements for the immediately foreseeable future well into the next century according to even the most pessimistic predictions But increasingly sophisticated exploration concepts and technology must be employed to maintain and if possible add to the reserve base Most of the world's fuel mineral resources are in sedimentary rocks Any procedure or concept that helps describe understand and predict the external geometry and internal attributes of major sedimentary units can therefore contribute to discovery and recovery of coal uranium and petroleum While conceding the desirability of renewable and nonpolluting energy supply from gravitational wind or solar sources the widespread deployment of these systems lies far in the future thus the continued commercial emphasis on conventional nonrenewable fuel mineral resources even though their relative significance will fluctuate with time For example a decade ago the prognostications for uranium were uniformly optimistic But in the early 1980s the uranium picture is quite sombre although unlikely to remain permanently depressed Whether uranium soars to the heights of early expectations remains to be seen Problems of waste disposal and public acceptance persist Fusion reactors may ultimately eliminate the need for uranium in power generation but for the next few decades there will be continued demand for uranium to fuel existing power plants and those that come on stream This book is to some extent a hybrid      **Middle and Upper Pennsylvanian System of North-central and West Texas (outcrop to**

**Subsurface)**, 1982      Compaction of Coarse-Grained Sediments, I G.V. Chilingarian, K.H. Wolf, 1975-01-01 Compaction of Coarse Grained Sediments I      **Terrigenous Clastic Depositional Systems** William E. Galloway, David K.

Hobday, 2012-12-06 Nonrenewable energy resources comprising fossil fuels and uranium are not randomly distributed within the Earth's crust They formed in response to a complex array of geologic controls notably the genesis of the sedimentary rocks that host most commercial energy resources It is this genetic relationship between economic resources and environment that forms the basis for this book Our grouping of petroleum coal uranium and ground water may appear to be incongruous or artificial But our basic premise is that these ostensibly disparate resources share common genetic attributes and that the sedimentological principles governing their natural distributions and influencing their recovery are fundamentally similar Our combined careers have focused on these four resources and our experiences in projects worldwide reveal that certain recurring geologic factors are important in controlling the distribution of commercial accumulations and

subsurface fluid flow These critical factors include the shape and stability of the receiving basin the major depositional elements and their internal detail and the modifications during burial that are brought about in these sediments by pressure circulating fluids heating and chemical reaction Since the first edition of this book in 1983 there has been a quantum leap in the volume of literature devoted to genetic stratigraphy and refinement of sedimentological principles and a commensurate increase in the application of these concepts to resource exploration and development
