

BIOMECHANICS OF NATURAL TEETH

The tooth is suspended syndesmotically within the alveolar bone by dentoalveolar bundles of collagen fibers. Because of its elasticity there is measurable horizontal, vertical, and rotational tooth mobility.

Basically, tooth movement can be subdivided into two phases:-

1. Desmodontal phase:-

referred to as *the first stage of movement*, taking place when a load of up to 100 N acts on the tooth. During this phase, the tooth moves slightly within the socket. Some periodontal fiber bundles are stretched, while others are relaxed. However, the alveolar process does not undergo marked deformation.
