Discrepancy Of Signed Measures And Polynomial Approximation:

Discrepancy of Signed Measures and Polynomial Approximation Vladimir V. Andrievskii, Hans-Peter Blatt, 2013-06-29 In many situations in approximation theory the distribution of points in a given set is of interest For example the suitable choice of interpolation points is essential to obtain satisfactory estimates for the convergence of interpolating polynomials Zeros of orthogonal polynomials are the nodes for Gauss quadrature formulas Alternation points of the error curve characterize the best approximating polynomials In classical complex analysis an interesting feature is the location of zeros of approximants to an analytic function In 1918 R Jentzsch [91] showed that every point of the circle of convergence of a power series is a limit point of zeros of its partial sums This theorem of Jentzsch was sharpened by Szegő [170] in 1923 He proved that for a power series with finite radius of convergence there is an infinite sequence of partial sums the zeros of which are equidistributed with respect to the angular measure In 1929 Bernstein [27] stated the following theorem Let f be a positive continuous function on $[0, 1]$ if almost all zeros of the polynomials of best L_2 approximation to f in a weighted L norm are outside of an open ellipse c with foci at 1 and -1 then f has a continuous extension that is analytic in c

The international conference entitled New Trends in Approximation Theory was held at the Fields Institute in Toronto from July 25 until July 29 2016 The conference was fondly dedicated to the memory of our unique friend and colleague Andr Boivin who gave tireless service in Canada until his very last moment of his life in October 2014 The impact of his warm personality and his fine work on Complex Approximation Theory was reflected by the mathematical excellence and the wide research range of the 37 participants In total there were 27 talks delivered by well established mathematicians and young researchers In particular 19 invited lectures were delivered by leading experts of the field from 8 different countries The wide variety of presentations composed a mosaic of aspects of approximation theory highlighting interesting connections with important contemporary areas of Analysis Primary topics discussed include application of approximation theory isoperimetric inequalities construction of entire order isomorphisms dynamical sampling approximation by harmonic and holomorphic functions especially uniform and tangential approximation polynomial and rational approximation zeros of approximants and zero free approximation tools used in approximation theory approximation on complex manifolds in product domains and in function spaces and boundary behaviour and universality properties of Taylor and Dirichlet series

Logarithmic Potentials with External Fields Edward B. Saff, Vilmos Totik, 2024-10-04 This is the second edition of an influential monograph on logarithmic potentials with external fields incorporating some of the numerous advancements made since the initial publication As the title implies the book expands the classical theory of logarithmic

potentials to encompass scenarios involving an external field This external field manifests as a weight function in problems dealing with energy minimization and its associated equilibria These weighted energies arise in diverse applications such as the study of electrostatics problems orthogonal polynomials approximation by polynomials and rational functions as well as tools for analyzing the asymptotic behavior of eigenvalues for random matrices all of which are explored in the book The theory delves into diverse properties of the extremal measure and its logarithmic potentials paving the way for various numerical methods This new updated edition has been thoroughly revised and is reorganized into three parts Fundamentals Applications and Generalizations followed by the Appendices Additions to the new edition include new material on the following topics analytic and C^2 weights differential and integral formulae for equilibrium measures constrained energy problems vector equilibrium problems and a probabilistic approach to balayage and harmonic measures a new chapter entitled Classical Logarithmic Potential Theory which conveniently summarizes the main results for logarithmic potentials without external fields several new proofs and sharpened forms of some main theorems expanded bibliographic and historical notes with dozens of additional references Aimed at researchers and students studying extremal problems and their applications particularly those arising from minimizing specific integrals in the presence of an external field this book assumes a firm grasp of fundamental real and complex analysis It meticulously develops classical logarithmic potential theory alongside the more comprehensive weighted theory
