Discrete Systems Simulation Using Gpss , Computer Controlled Systems G. Perdikaris, 1991-09-30 The primary objective of the book is to provide advanced undergraduate or first year graduate engineering students with a self contained presentation of the principles fundamental to the analysis design and implementation of computer controlled systems The material is also suitable for self study by practicing engineers and is intended to follow a first course in either linear systems analysis or control systems A secondary objective of the book is to provide engineering and or computer science audiences with the material for a junior senior level course in modern systems analysis Chapters 2 3 4 and 5 have been designed with this purpose in mind The emphasis in such a course is to develop the

mathematical tools and methods suitable for the analysis and design of real time systems such as digital filters. Thus engineers and or computer scientists who know how to program computers can understand the mathematics relevant to the issue of what it is they are programming. This is especially important for those who may work in engineering and scientific environments where for instance programming difference equations for real time applications is becoming increasingly common. A background in linear algebra should be an adequate prerequisite for the systems analysis course. Chapter 1 of the book presents a brief introduction to computer controlled systems. It describes the general issues and terminology relevant to the analysis design and implementation of such systems.
