Fast Gradient Elution Reversed-Phase HPLC with Diode-Array Detection as a High Throughput Screening Method for Drugs of Abuse

Peter W. Carr, K. M. Fuller, D. R. Stoll, M. S. Pasha, L. D. Steinkraus, Glenn G. Hardin, 2005 A new approach has been developed by modifying a conventional gradient elution liquid chromatograph for the high throughput screening of biological samples to detect the presence of regulated intoxicants The goal of this work was to improve the speed of a gradient elution screening

method over current approaches by optimizing the operational parameters of both the column and the instrument without compromising the reproducibility of the retention times which are the basis for the identification. Most importantly the novel instrument configuration substantially reduces the time needed to re-equilibrate the column between gradient runs thereby reducing the total time for each analysis. The total analysis time for each gradient elution run is only 2.8 minutes including 0.3 minutes for column re-equilibration between analyses. Retention times standard calibration solutes are reproducible to better than 0.002 minutes in consecutive runs. A corrected retention index was adopted to account for day to day and column to column variations in retention time. The discriminating power and mean list length were calculated for a library of 47 intoxicants and compared with previous work from other laboratories to evaluate fast gradient elution HPLC as a screening tool.

Veronika Meyer's book is a classic HPLC text and remains one of the few titles on general HPLC. Following on from the excellent success of the first two editions this third edition continues to provide postgraduate students using HPLC and users of HPLC in industry pharmaceuticals with a unified approach to HPLC and an equal treatment of the theory and practice of HPLC. This edition provides numerous additions and updated material including 10 out of 26 chapters

substantially revised. Synopsis of the most important formulas. Inclusion of chapters on solvent properties and on instrument tests. Completely rewritten chapter on pumps. Updated figures and references.

Application of the Combined Use of HPLC/Diode Array Detection and Capillary GC/Nitrogen Phosphorus Detection for the Rapid Analysis of Illicit Heroin and Cocaine Samples AF. Hernández, A. Pla, J. Moliz, F. Gil, MC. Gonzalvo, E. Villanueva, 1992. A method using a combination of high performance liquid chromatography and diode array detection HPLC DAD with a methanol perchlorate buffer pH 2.5 mobile phase and reverse phase C18 column and capillary gas chromatography with nitrogen phosphorus detection GC NPD has been developed for the rapid sensitive and accurate analysis of illicit samples of heroin or cocaine. Retention times and UV spectra were used for the identification of various adulterants and synthetic by products in street samples. This method is compared with gas chromatography mass spectrometry GC MS. Forty street samples were analyzed by both methods. It is concluded that the combined use of HPLC DAD and GC NPD as a routine analytical procedure for the analysis of illicit samples could be a good alternative to GC MS for forensic purposes. It is due to their high accessibility and the possibility to perform simultaneously qualitative and quantitative analysis.
