Characterization of Macromolecular Structure ,1968 *Macromolecular Engineering, Volume 1* Krzysztof Matyjaszewski,Yves Gnanou,Ludwik Leibler,2007-04-09 The book provides a state of the art description of the synthetic tools to precisely control various aspects of macromolecular structure including chain composition microstructure functionality and topology as well as modern characterization techniques at molecular and macroscopic level for various properties of well defined co polymers in solution bulk and at surfaces The book addresses also the correlation of molecular structure with macroscopic properties additionally affected by processing Finally some emerging applications for the co polymers are highlighted *Macromolecules* Finn Wold,1971 In this book we discuss the status of the structure function analysis of biological macromolecules and macromolecular complexes The ultimate goal of the analysis must be to explain all the functional properties of the molecules in question in terms of their completely defined three dimensional structure and the analysis thus contains three separate components the determination of structure the determination and quantitation of function and final correlation of this information into the structure function model The first component the structural analysis is reviewed only briefly and this book therefore leans heavily on Barker s and Van Holde s books in this series for proper background and documentation for this component The second component the analysis of functional properties is given broader consideration Chapters I 2 5 and 9 but the main emphasis has been the step by step development of the structure function models It is hoped that this approach will clearly illustrate the typical progression of scientific model building from the first clear definition of the problem and the statement of the hypothesis through ever increasing refinements of experimental tests toward the final answer It is also hoped that the statements of philosophy principles and scientific method that are the bases for this approach are of broad enough validity to survive even after its models have become obsolete With this approach it is essential to inform the reader in unequivocal terms that this book is not a summary of final conclusions

and complete stories which can be submitted to memory Each system discussed should be considered very critically and the models should be evaluated in terms of the available evidence The only facts are the experimental data the interpretation of this data into models is only convincing to the extent that it makes logical sense to the individual examining it Since both space and common sense prohibits a continuous reiteration of this statement throughout the book be prepared to encounter some models and hypotheses which are based on sound experimental evidence as well as some which have no experimental basis at all In neither case are they facts but in either case they represent ideas which can be subjected to further experimental tests If the book helps to sharpen this critical evaluation of both ideas and the experimental test of the hypotheses one of its major purposes has been fulfilled **Biomedical Index to PHS-supported Research** ,1991

Hierarchical Macromolecular Structures: 60 Years after the Staudinger Nobel Prize II Virgil Percec,2014-07-08 Advances in Polymer Science enjoys a longstanding tradition and good reputation in its community Each volume is dedicated to a current topic and each review critically surveys one aspect of that topic to place it within the context of the volume The volumes typically summarize the significant developments of the last 5 to 10 years and discuss them critically presenting selected examples explaining and illustrating the important principles and bringing together many important references of primary literature On that basis future research directions in the area can be discussed Advances in Polymer Science volumes thus are important references for every polymer scientist as well as for other scientists interested in polymer science as an introduction to a neighboring field or as a compilation of detailed information for the specialist

Macromolecules, Volume 3 Hans-Georg Elias,2005 Providing a broad survey of the entire field Macromolecules integrates representations of chemistry physics and technology as well as including precise descriptions of basic phenomena and balanced treatments of facts and theory *Analysis of Macromolecular Structure Through Experiment and Computation* John Jared Gossett,2013 This thesis covers a wide variety of projects within the domain of computational structural biology Structural biology is concerned with the molecular structure of proteins and nucleic acids and the relationship between structure and biological function We used molecular modeling and simulation a purely computational approach to study DNA linked molecular nanowires We developed a computational tool that allows potential designs to be screened for viability and then we used molecular dynamics MD simulations to test their stability As an example of using molecular modeling to create experimentally testable hypotheses we were able to suggest a new design based on pyrrole vinylene monomers In another project we combined experiments and molecular modeling to gain insight into factors that influence the kinetic binding dynamics of fibrin knob peptides and complementary holes Molecular dynamics simulations provided helpful information about potential peptide structural conformations and intrachain interactions that may influence binding properties The remaining projects discussed in this thesis all deal with RNA structure The underlying approach for these studies is a recently developed chemical probing technology called 2 hydroxyl acylation analyzed by primer extension SHAPE One study

focuses on ribosomal RNA specifically the 23S rRNA from T thermophilus We used SHAPE experiments to show that Domain III of the T thermophilus 23S rRNA is an independently folding domain This first required the development of our own data processing program for generating quantitative and interpretable data from our SHAPE experiments due to limitations of existing programs and modifications to the experimental protocol In another study we used SHAPE chemistry to study the in vitro transcript of the RNA genome of satellite tobacco mosaic virus STMV This involved incorporating the SHAPE data into a secondary structure prediction program The SHAPE directed secondary structure of the STMV RNA was highly extended and considerably different from that proposed for the RNA in the intact virion Finally analyzing SHAPE data requires navigating a complex data processing pipeline We review some of the various ways of running a SHAPE experiment and how this affects the approach to data analysis
