Charge Transport in Self-assembling Discotic Liquid Crystalline Materials A. M. Van de Craats,2000 **Charge Transport in Discotic Liquid Crystals** Leon James McBride Lever,2006 **Chemistry of Discotic Liquid Crystals** Sandeep Kumar,2016-04-19 The self contained properties of discotic liquid crystals DLCs render them powerful functional materials for many semiconducting device applications and models for energy and charge migration in self organized dynamic functional soft materials The past three decades have seen tremendous interest in this area fueled primarily by the possibility **Study of Liquid Crystalline Materials and Their Application in Organic Light Emitting Diodes** Rong Fan,2001 **Discotic Liquid Crystals** Olga Viktorovna Kruglova,2007 Deals with the dependency between structure and dynamics and its influence on charge transfer properties of self assembling discotic liquid crystalline materials This title provides an overview of liquid crystals in general and discotic liquid crystals in particular It discusses a theory of neutron scattering **A Planarized Triphenylborane Mesogen: Discotic Liquid Crystals with Ambipolar Charge-Carrier Transport Properties**¹ ,2015 Abstract A discotic liquid crystalline LC material consisting of a planarized triphenylborane mesogen was synthesized X ray diffraction analysis confirmed that this compound forms a hexagonal columnar LC phase with an interfacial distance of 3.57 between the discs At ambient temperature this boron centered discotic liquid crystal exhibited ambipolar carrier transport properties with electron and hole mobility values of approximately 10^{-3} and 3×10^{-5} cm² V⁻¹ s⁻¹ respectively **Unconventional Liquid Crystals and Their Applications** Wei Lee,Sandeep Kumar,2021-07-19 The work focuses on recent developments of the rapidly evolving field of Non conventional Liquid Crystals After a concise introduction it discusses the most promising research such as biosensing elastomers polymer films photoresponsive properties and energy harvesting Besides future applications it discusses as well potential frontiers in LC science and technology Liquid Crystalline Semiconductors Richard J. Bushby,Stephen M. Kelly,Mary O'Neill,2012-11-23 This is an exciting stage in the development of organic electronics It is no longer an area of purely academic interest as increasingly real applications are being developed some of which are beginning to come on stream Areas that have already been commercially developed or which are under intensive development include organic light emitting diodes for flat panel displays and solid state lighting organic photovoltaic cells organic thin film transistors for smart tags and flat panel displays and sensors Within the family of organic electronic materials liquid crystals are relative newcomers The first electronically conducting liquid crystals were reported in 1988 but already a substantial literature has developed The advantage of liquid crystalline semiconductors is that they have the easy processability of amorphous and polymeric semiconductors but they usually have higher charge carrier mobilities Their mobilities do not reach the levels seen in crystalline organics but they circumvent all of the difficult issues of controlling crystal growth and morphology Liquid crystals self organise they can be aligned by fields and surface forces and because of their fluid nature defects in liquid crystal structures readily self heal With these matters in mind this is an

opportune moment to bring together a volume on the subject of Liquid Crystalline Semiconductors The field is already too large to cover in a comprehensive manner so the aim has been to bring together contributions from leading researchers which cover the main areas of the chemistry synthesis and structure function relationships physics charge transport mechanisms and optical properties and potential applications in photovoltaics organic light emitting diodes OLEDs and organic field effect transistors OFETs This book will provide a useful introduction to the field for those in both industry and academia and it is hoped that it will help to stimulate future developments

Tatum, 2013 This dissertation describes the use of discotic liquid crystals for two different areas of research advances in new organic photovoltaic cell OPVC technologies and the development of new nanoporous membranes Discotic liquid crystals DLCs generally consist of a central polycyclic aromatic hydrocarbon core that is generally ridged and crystalline in nature The central core is decorated with alkyl chains in order to induce liquid crystallinity Within their mesophase DLCs spontaneously form columnar structures with close intracolumnar disc disc distances Due to the close disc disc packing the conjugated aromatic cores act as one dimensional charge carriers The spontaneous alignment of DLCs is ideal for electronic applications namely OPVCs We describe the synthesis of a new boronic ester containing discotic liquid crystal that is highly electron deficient and displays high charge carrier mobilities The scope of the boronic ester formation and its application to liquid crystals was explored with the development of two new boronic ester containing non planar discotic liquid crystals A new approach toward completely DLC based OPVCs is described and explored The miscibility of the non planar discotic liquid crystals with planar discotic liquid crystals which is a key requirement for the alignment of the desired OPVC was tested In many membranes used for industrial applications a great deal of energy is put into forcing materials into certain alignments However in our approach toward a DLC based nanoporous membrane we utilize the spontaneous alignment of liquid crystals in order to make desirable molecular architectures By adding polymerizable units to the periphery of a DLC we lock the mesophase alignment upon polymerization Due to the highly labile nature of the boron oxygen bonds that surround the central core of our boronic ester containing DLC we are able to then remove the DLC cores revealing a nanoporous membrane templated by the DLC mesophase alignment The polymerized material with the cores removed has a remarkably high pore density contains only one pore size and has linear pores templated by the columnar DLC mesophase
