A Naturalist's Voyage Round the World Charles Darwin, 2016-02-22 Chapter I Porto Praya Ribeira Grande Atmospheric Dust with Infusoria Habits of a Sea slug and Cuttle fish St Paul s Rocks non volcanic Singular Incrustations Insects the first Colonists of Islands Fernando Noronha Bahia Burnished Rocks Habits of a Diodon Pelagic Conferv and Infusoria Causes of discoloured Sea ST JAGO CAPE DE VERD ISLANDS After having been twice driven back by heavy south western gales Her Majesty s ship Beagle a ten gun brig under the command of Captain Fitz Roy R N sailed from Devonport on the 27th of December 1831 The object of the expedition was to complete the survey of Patagonia and Tierra del Fuego commenced under Captain King in 1826 to 1830 to survey the shores of Chile Peru and of some islands in the Pacific and to carry a chain of chronometrical measurements round the World On the 6th of January we reached Teneriffe but were prevented landing by fears of our bringing the cholera the next morning we saw the sun rise behind the rugged outline of the Grand Canary Island and suddenly illumine the Peak of Teneriffe whilst the lower parts were veiled in fleecy clouds This was the first of many delightful days never to be forgotten On the 16th of January 1832 we anchored at Porto Praya in St Jago the chief island of the Cape de Verd archipelago Charles Darwin and His World Julian Huxley, H. B. D. Kettlewell, 1965 **A Naturalist's Voyage Round the World** Charles Darwin M.A. F.R.S., 2012-03-01 The nature of the following work will be best understood by a brief account of how it came to be written During many years I collected notes on the origin or descent of man without any intention of publishing on the subject but rather with the determination not to publish as I thought that I should thus only add to the prejudices against my views It seemed to me sufficient to indicate in the first edition of my Origin of Species that by this work light would be thrown on the origin of man and his history and this implies that man must be included with other organic beings in any general conclusion respecting his manner of appearance on this earth Now the case wears a wholly different aspect When a naturalist like Carl Vogt ventures to say in his address as President of the National Institution of Geneva 1869 *personne en Europe au moins n ose plus soutenir la creation independante et de toutes pieces des especes* it is manifest that at least a large number of naturalists must admit that species are the modified descendants of other species and this especially holds good with the younger and rising naturalists The greater number accept the agency of natural selection though some urge whether with justice the future must decide that I have greatly overrated its importance Of the older and honoured chiefs in natural science many unfortunately are still opposed to evolution in every form In consequence of the views now adopted by most naturalists and which will ultimately as in every other case be followed by others who are not scientific I have been led to put together my notes so as to see how far the general conclusions arrived at in my former works were applicable to man This seemed all the more desirable as I had never deliberately applied these views to a species taken singly When we confine our attention to any one form we are deprived of the weighty arguments derived from the nature of the affinities which connect together whole groups of organisms their geographical distribution in past and present

times and their geological succession The homological structure embryological development and rudimentary organs of a species remain to be considered whether it be man or any other animal to which our attention may be directed but these great classes of facts afford as it appears to me ample and conclusive evidence in favour of the principle of gradual evolution The strong support derived from the other arguments should however always be kept before the mind The sole object of this work is to consider firstly whether man like every other species is descended from some pre existing form secondly the manner of his development and thirdly the value of the differences between the so called races of man As I shall confine myself to these points it will not be necessary to describe in detail the differences between the several races an enormous subject which has been fully described in many valuable works The high antiquity of man has recently been demonstrated by the labours of a host of eminent men beginning with M Boucher de Perthes and this is the indispensable basis for understanding his origin I shall therefore take this conclusion for granted and may refer my readers to the admirable treatises of Sir Charles Lyell Sir John Lubbock and others Nor shall I have occasion to do more than to allude to the amount of difference between man and the anthropomorphous apes for Prof Huxley in the opinion of most competent judges has conclusively shewn that in every visible character man differs less from the higher apes than these do from the lower members of the same order of Primates

*Charles Darwin's Life With Birds* Clifford B. Frith, 2016-06-01 Much of Charles Darwin s groundbreaking work as an evolutionary biologist stemmed from his study of birds It is universally acknowledged that Darwin s observation of bird groups and species like the Galapagos finches mockingbirds and rock doves was critical to the development of his theories on natural selection evolution and sexual selection The significant number of diverse birds that Darwin covered in his published works represents a most substantial ornithological contribution His major books alone contain reference to and consideration of almost 500 bird species as well as interesting and pertinent discussion of over 100 ornithological topics Charles Darwin s *Birds* is a comprehensive treatment of Darwin s work as an ornithologist Clifford Frith discusses every ornithological topic and bird species that Darwin researched providing a complete historical survey of his published writing on birds Through this we learn how Darwin became an increasingly skilled and eventually exceptional ornithologist and how his relationships grew with contemporary scientists like John Gould It examines how Darwin was influenced by birds and how the major themes of his research developed through his study of them The book also features 4 appendices which contain brief accounts of every bird species Darwin wrote about basic ornithological information about each of the species and a listing of where the species appears in Darwin s work

*On The Origin Of Species* Charles Darwin, 2014-07-22 Published in 1859 The Origin of Species by Charles Darwin introduced the theory of natural selection to a newly receptive public As a young naturalist on the second voyage of HMS Beagle 1831-36 Darwin collected many plant and animal specimens and it was his close examination of them that eventually led to his theories on evolution and natural selection The theory of evolution was quickly accepted by the scientific community The Origin of Species heavily influenced

the secularization of science in the late nineteenth century but it was not until the 1930s and 40s when consensus was reached on how evolution works that it was agreed that natural selection was the main mechanism in the evolutionary process HarperTorch brings great works of non fiction and the dramatic arts to life in digital format upholding the highest standards in ebook production and celebrating reading in all its forms Look for more titles in the HarperTorch collection to build your digital library

**The Origin of Species (Charles Darwin)** Charles Darwin,2016-12-05 Darwin s theory is based on the notion of variation It argues that the numerous traits and adaptations that differentiate species from each other also explain how species evolved over time and gradually diverged Variations in organisms are apparent both within domesticated species and within species throughout the natural world Variations in colors structures organs and physical traits differentiate a multitude of species from one another Heredity is the mechanism that perpetuates variations Darwin argues as traits are passed from parents to offspring What is important about these variations to Darwin though is the way they allow species to adapt and survive in the natural world He gives numerous examples of variations that illustrate the wondrous adaptations that allow species to survive in their natural environments the beak that allows the woodpecker to gather insects the wings that allow the bat to fly the paddles that allow the porpoise to swim and so on Darwin hypothesizes that the minor variations we see within a single species such as variations in size shape and color of organisms are related to the more distinct variations seen across different species His theory of evolution explains how variations cause the origin of species
