Charles Darwins The Origin Of Species:

The Origin Of Species Charles Darwin, 2013-12-22 Charles Darwin's *Origin of Species* publ 1859 is a pivotal work in scientific literature and arguably the pivotal work in evolutionary biology. The book's full title is *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. It introduced the theory that populations evolve over the course of generations through a process of natural selection. It was controversial because it contradicted religious beliefs which underlay the then current theories of biology. Darwin's book was the culmination of evidence he had accumulated on the voyage of the *Beagle* in the 1830s and added to through continuing investigations and experiments since his return.

On the Origin of Species Charles Darwin, 2008-11-13 Can we doubt that individuals having any advantage, however slight, over others would have the best chance of surviving and of procreating their kind? In the *Origin of Species* 1859 Darwin challenged many of the most deeply held beliefs of the Western world. His insistence on the immense length of the past and on the abundance of life forms present and extinct dislodged man from his central position in creation and called into question the role of the Creator. He showed that new species are achieved by natural selection and that absence of plan is an inherent part of the evolutionary process. Darwin's prodigious reading, experimentation and observations on his travels fed into his great work which draws on material from the Galapagos Islands to rural Staffordshire, from English back gardens to colonial encounters. The present edition provides a detailed and accessible discussion of his theories and adds an account of the immediate responses to the book on publication. The resistances as well as the enthusiasms of the first readers cast light on recent controversies particularly concerning questions of design and descent.

On the Origin of Species Charles Darwin, 2009 Darwin's Idea: Evolution through natural selection actually explains the meaning of life; it is the biggest single idea ever; its breadth and scope enormous; its means so perfectly economic; its capacity to shock and excite persist to this day. Such emotion and passion over a search for essential truth are also the substance of art: such belief and relevance, its goals. The myriad ways of understanding and expressing the beauty of life are a constant inspiration. There's an infinite number of ways to get to the same point.

The Origin of Species Charles Darwin, 2010. This book discusses Darwin's theory of evolution and explains that the theory is still argued and debated today. **The Origin of Species (Charles Darwin)** Charles Darwin, 2016-12-05. Darwin's theory is based on the notion of variation. It argues that the numerous traits and adaptations that differentiate species from each other also explain how species evolved over time and gradually diverged. Variations in organisms are apparent both within domesticated species and within species throughout the natural world. Variations in colors, structures, organs, and physical traits differentiate a multitude of species from one another. Heredity is the mechanism that perpetuates variations, Darwin argues, as traits are passed from parents to offspring. What is important about these variations to Darwin though is the way they allow species to adapt and survive in the natural world. He gives numerous examples of variations that illustrate the wondrous adaptations that allow species to survive in their natural environments: the beak that allows the woodpecker to gather insects, the wings that allow the bat to fly, the paddles that allow the porpoise to swim, and so on. Darwin hypothesizes that the minor variations we see within a single species, such as variations in size, shape, and color of organisms, are related to the more distinct variations seen across different species. His theory of evolution explains how variations cause the origin of species.

When on board H M S Beagle as naturalist I was much struck with certain facts in the distribution of the inhabitants of South America and in the geological relations of the present to the past inhabitants of that continent These facts seemed to me to throw some light on the origin of species that mystery of mysteries as it has been called by one of our greatest philosophers On my return home it occurred to me in 1837 that something might perhaps be made out on this question by patiently accumulating and reflecting on all sorts of facts which could possibly have any bearing on it After five years work I allowed myself to speculate on the subject and drew up some short notes these I enlarged in 1844 into a sketch of the conclusions which then seemed to me probable from that period to the present day I have steadily pursued the same object I hope that I may be excused for entering on these personal details as I give them to show that I have not been hasty in coming to a decision
