

# Diffusion: Role of the microstructure (I)

Self-diffusion coefficients for Ag depend on the diffusion path. In general the diffusivity is greater through less restrictive structural regions – grain boundaries, dislocation cores, external surfaces.

*Impurity Diffusion in Metals* G. Neumann, C. Tuijn, 2002 The systematic investigation of self diffusion and impurity diffusion in metals began as a result of the availability of a wide variety of artificial radio isotopes following the Second World War During the following years rapid advances in the theory of solid state diffusion and the ever increasing number of experimental data were comprehensively described in any number of textbooks and review papers But impurity diffusion in metals was more or less superficially treated in the textbooks and some of the review papers with the result that even up to now a comprehensive review of the correct interpretation of impurity diffusion in metals has been lacking

*Atomic Transport in Solids* A. R. Allnatt, A. B. Lidiard, 2003-10-30 This book provides the fundamental statistical theory of atomic transport in crystalline solids that is the means by which processes occurring at the atomic level are related to macroscopic transport coefficients and other observable quantities The cornerstones of the authors treatment are i the physical concepts of lattice defects ii the phenomenological description provided by non equilibrium thermodynamics and iii the various methods of statistical mechanics used to link these kinetic theory random walk theory linear response theory etc The book is primarily concerned with transport in the body of crystal lattices and not with transport on surfaces within grain boundaries or along dislocations although much of the theory here presented can be applied to these low dimensional structures when they are atomically well ordered and regular
