Remote Work and City Structure Ferdinando Monte, Charly Porcher, Esteban Rossi-Hansberg, 2023 We study the adoption of remote work within cities and its effect on city structure and welfare We develop a dynamic model of a city in which workers can decide to work in the central business district CBD or partly at home Working in the CBD allows them to interact with other commuters which enhances their productivity through a standard production externality but entails commuting costs Switching between modes of labor delivery is costly and workers face idiosyncratic preference shocks for remote work We characterize the parameter set in which the city exhibits multiple stationary equilibria Within this set a coordination mechanism can lead to stationary equilibria in which most workers commute or most of them work partially from home In these cases large shocks in the number of commuters like the recent lockdowns and self isolation generated by the COVID 19 pandemic can result in dynamic paths that make cities converge to a stationary equilibrium with large fractions of remote workers Using cell phone based mobility data for the U S we document that although most cities experienced similar reductions in CBD trips during the pandemic trips in the largest cities have stabilized at levels that are only about 60% of pre pandemic levels In contrast smaller cities have on average returned to pre pandemic levels House price panel data by city show consistent changes in house price CBD distance gradients We estimate the model for 274 U S cities and show that cities that have stabilized at a large fraction of remote work are much more likely to have parameters that result in multiple stationary equilibria Our results imply welfare losses in these cities that average 2.7%
