

Controlled Thermonuclear Reactions

- Because of the large amount of energy produced and the relatively small Coulomb barrier, the first fusion reaction will most likely be the D + T reaction. The tritium will be derived from two possible reactions:

- The problem of controlled fusion involves significant scientific and engineering difficulties. The two major schemes to control thermonuclear reactions are magnetic confinement fusion (MCF) and inertial confinement fusion (ICF).
- Magnetic confinement of plasma is done in a **tokamak**, which has many confinement boundaries.
- Heating of the plasma to sufficiently high temperatures begins with the resistive heating from the electric current flowing in the plasma. There are two other schemes to add additional heat: (1) injection of high-energy (40–120 keV) neutral (so they pass through the magnetic field) fuel atoms that interact with the plasma, and (2) radio-frequency (RF) induction heating of the plasma (similar to a microwave oven).

Joachain, 2013-06-29 The need for long term energy sources in particular for our highly technological society has become increasingly apparent during the last decade One of these sources of tremendous potential importance is controlled thermonuclear fusion The goal of controlled thermonuclear fusion research is to produce a high temperature completely ionized plasma in which the nuclei of two hydrogen isotopes deuterium and tritium undergo enough fusion reactions so that the nuclear energy released by these fusion reactions can be transformed into heat and electricity with an overall gain in energy This requires average kinetic energies for the nuclei of the order of 10 keV corresponding to temperatures of about 100 million degrees Moreover the plasma must remain confined for a certain time interval during which sufficient energy must be produced to heat the plasma overcome the energy losses and supply heat to the power station At present two main approaches are being investigated to achieve these objectives magnetic confinement and inertial confinement In magnetic confinement research a low density plasma is heated by electric currents assisted by additional heating methods such as radio frequency heating or neutral beam injection and the confinement is achieved by using various magnetic field configurations Examples of these are the plasmas produced in stellarator and tokamak devices **Research on Controlled**
