**Abstract:** Cardiac monitoring can be performed by means of an accelerometer attached to a subject's chest, which produces the Seismocardiography (SCG) signal. Detection of SCG heartbeats is commonly carried out by taking advantage of a simultaneous electrocardiogram (ECG). SCG-based long-term monitoring would certainly be less obtrusive and easier to implement without an ECG. Few studies have addressed this issue using a variety of complex approaches. This study proposes a novel approach to ECG-free heartbeat detection in SCG signals via template matching, based on normalized cross-correlation as heartbeats similarity measure. The algorithm was tested on the SCG signals acquired from 77 patients with valvular heart diseases, available from a public database. The performance of the proposed approach was assessed in terms of sensitivity and positive predictive value (PPV) of the heartbeat detection and accuracy of inter-beat intervals measurement. Sensitivity and PPV of 96% and 97%, respectively, were obtained by considering templates that included both systolic and diastolic complexes. Regression, correlation, and Bland–Altman analyses carried out on inter-beat intervals reported slope and intercept of 0.997 and 2.8 ms ( $R^2 > 0.999$ ), as well as non-significant bias and limits of agreement of  $\pm 7.8$  ms. The results are comparable or superior to those achieved by far more complex algorithms, also based on artificial intelligence. The low computational burden of the proposed approach makes it suitable for direct implementation in wearable devices.

## 1. Introduction

Continuous heart rate monitoring is fundamental in critical medical circumstances to assess cardiac function. It is a vital task in intensive care units, surgery, post-anesthesia surveillance, and emergency medicine [1–3]. Heart rate monitors are extensively used for analysis of heart rate variability (HRV), which is considered a strong predictor of the outcome in patients with high cardiovascular risk [4,5]. Indeed, people with coronary artery disease, heart failure, valvular heart disease, or after a myocardial infarction, ischemia, or a stroke need to be continuously monitored to provide them with timely therapeutic intervention, thus preventing the deterioration of health conditions and the occurrence of fatal arrhythmic events [1,4,6]. HRV analysis has also been recognized as a valuable non-invasive tool for identifying cardiac autonomic dysfunction in neurological (e.g., multiple sclerosis), renal (e.g., end-stage renal failure), or metabolic (e.g., diabetes, obesity) diseases [6–10]. Moreover, heart rate and HRV indices can be useful: in sleep medicine to assess sleep quality and detect sleep apnea syndrome, or neonatal distress syndrome [1,6,8,11]; in fitness and sport science to monitor exercise training and the performance of athletes [8,12,13]; or even in rehabilitation medicine to track the exercise of chronic patients [1,8]. Furthermore, they can provide valuable information: to evaluate the effect of drugs [8]; to monitor stress levels and obtain clear evidence of emotion disorders (e.g., anxiety, depression, etc.) [1,14]; to promote lifestyle awareness in people and improve their well-being [1,8]; and to enhance road safety by detecting driver fatigue [15].
