Fátima Baptista ,Federico Baronio,2025-11-20 Given the success of the previous collection Bone Health and Development in Children and Adolescents we are pleased to announce the launch of Volume II Bone health and development in children and adolescents is a critical area of research as it lays the foundation for bone related health outcomes in later life During adolescence approximately 50% of an adult s peak total body bone minerals are accrued with over 80% of bone mass achieved by the age of 18 This period is crucial for ensuring adequate nutrient intake and dietary habits which are essential

for optimal bone health and growth potential Furthermore the volume and intensity of physical activity during these formative years significantly influence bone mineral content and density serving as a preventive measure against bone loss and diseases in adulthood Despite these insights there remain gaps in understanding the interplay between modifiable and non modifiable factors such as genetics and disease in bone growth and development Early detection of these non modifiable determinants is vital for identifying adolescents at risk of low bone mass allowing for lifestyle modifications that can enhance bone mineral accrual and prevent future bone related diseases This research topic aims to explore the multifaceted aspects of bone health and development in children and adolescents It seeks to address specific questions regarding the impact of both modifiable and non modifiable factors on bone growth the effectiveness of various therapies and medications in maintaining bone mass accrual and the role of primary bone disorders By investigating these areas the research aims to provide a comprehensive understanding of the determinants of bone health during these critical developmental stages and to propose strategies for optimizing bone health outcomes To gather further insights into the complex dynamics of bone health in children and adolescents we welcome articles addressing but not limited to the following themes Primary bone disorders Therapies and medications aiming at maintaining bone mass accrual Impact of modifiable and non modifiable factors on bone health and development Disorders of muscle impacting skeletal health

Optimal Physical Activity across the Lifespan for People of All Abilities Ronald F. Zernicke , David Arthur Hart, Humans evolved to be mobile within the boundary conditions of Earth and many biological and physiologic systems depend on mechanical loading to maintain integrity during growth and maturation during skeletal maturity and during the aging process These systems subscribe to the use it or lose it principle and thus require continual use to maintain integrity Given that premise considerable basic and clinical research efforts have been directed at optimizing the effectiveness and positive impact of exercise on sports performance and the well being of those with intact systems However those with disabilities or compromised abilities also benefit from exercise protocols and there exists a need to focus attention on these populations as well Given the myriad of biological and physiological systems that benefit from exercise and mechanical loading there is a need for all humans of varying abilities to not only maintain the integrity of their health but to attempt to optimize it recognizing that optimizing each person's health across the stages of the life cycle may require different exercise protocols dependent on stage of life sex genetics and other individualized variables

For those with physical disabilities embracing and maintaining such exercise protocols may be challenging but expanded research translation of findings and integration of the outcomes into everyday life to enhance the health and well being of this significant population are needed going forward
