My Hardcover Book Saeed Ullah Jan, 2018-01-28 Life in today's world would be unimaginable without computers. They have made human lives better and happier. There are many computer uses in different fields of work. Engineers, architects, jewelers, and filmmakers all use computers to design things. Teachers, writers, and most office workers use computers for research, word processing, and emailing. Small businesses can use computers as a point of sale and for general record keeping. Computers are now the major entertainers and the primary pass time machines. We can use computers for playing games, watching movies, listening to music, drawing pictures. Most of the medical information can now be digitized from the prescription to reports. Computation in the field of medicine allows us to offer varied miraculous therapies to the patients. ECG's, radiotherapy wasn't possible without computers.

Building Embedded Linux Systems Karim Yaghmour, 2003-04-22 Linux is being adopted by an increasing number of embedded systems developers who have been won over by its sophisticated scheduling and networking, its cost free license, its open development model, and the support offered by rich and powerful programming tools. While there is a great deal of hype surrounding the use of Linux in embedded systems, there is not a lot of practical information. Building Embedded Linux Systems is the first in depth hard core guide to putting together an embedded system based on the Linux kernel. This indispensable book features arcane and previously undocumented procedures for Building your own GNU development toolchain, Using an efficient embedded development framework, Selecting, configuring, building, and installing a target specific kernel, Creating a complete target root filesystem, Setting up, manipulating, and using solid state storage devices, Installing and configuring a bootloader for the target, Cross compiling a slew of utilities and packages, Debugging your embedded system using a plethora of tools and techniques. Details are provided for various target architectures and hardware configurations including a thorough review of Linux's support for embedded hardware. All explanations rely on the use of open source and free software packages. By presenting how to build the operating system components from pristine sources and how to find more documentation or help, this book greatly simplifies the task of keeping complete control over one's embedded operating system, whether it be for technical or sound financial reasons. Author Karim Yaghmour, a well known designer and speaker who is responsible for the Linux Trace Toolkit, starts by discussing the strengths and weaknesses of Linux as an embedded operating system. Licensing issues are included, followed by a discussion of the basics of building embedded Linux systems. The configuration setup and use of over forty different open source and free software packages commonly used in embedded Linux systems are also covered. uClibc, BusyBox, U-Boot, OpenSSH, tftpd, tftp, strace, and gdb are among the packages discussed.
