Dynamical Phenomena at Surfaces, Interfaces and Superlattices, Dynamical Phenomena at Surfaces, Interfaces and Superlattices Fabrizio Nizzoli, Karl-Heinz Rieder, Roy F. Willis, 2012-03-01 **Dynamical Phenomena at Surfaces, Interfaces, and Superlattices** Fabrizio Nizzoli, Karl-Heinz Rieder, R. F. Willis, 1985 Structure and Dynamics of Surfaces I W. Schommers, P.v. Blanckenhagen, 2013-03-08 During the last decade surface research has clearly shifted its interest from the macroscopic to the microscopic scale a wealth of novel experimental techniques and theoretical methods have been applied and developed successfully The Topics volume at hand gives an account of this tendency For the understanding of surface phenomena and their exploitation in technical applications the theoretical and experimental analysis at the microscopic level is of particular interest In heterogeneous catalysis for example a chemical reaction takes place at the interface of two phases and the process occurring at the surface is composed of a sequence of individual microscopic steps These individual steps include adsorption desorption surface diffusion and reaction on the surface These elementary steps are greatly influenced by the structure and the dynamics of the surface region Especially the catalytic activity may strongly depend on the structure of the catalyst's surface The necessity of performing surface investigations on a microscopic scale is also reflected clearly in research work relating to metal semiconductor interfaces which determine essentially the properties of electronic device materials The experimental probe on the atomic scale coupled with parallel theoretical calculations showed that the electronic properties of a metal semiconductor interface strongly depend on the crystallographic structure of the semiconductor in particular it is important to know in this context the modification of the atomic arrangement in the surface region caused by the termination of the crystal by the surface *Semiconductor Surfaces and Interfaces* Winfried Mönch, 2013-03-09 *Semiconductor Surfaces and Interfaces* deals with structural and electronic properties of semiconductor surfaces and interfaces The first part introduces to the general aspects of space charge layers of clean surface and adatom induced surface states and of interface states It is followed by a presentation of experimental results on clean and adatom covered surfaces which are explained in terms of simple physical and chemical concepts and models Where available results of more refined calculations are considered A final chapter is devoted to the band lineup at semiconductor interfaces **Stability of Materials** A. Gonis, Josef Kudrnovský, Patrice E.A. Turchi, 2012-12-06 Engineering materials with desirable physical and technological properties requires understanding and predictive capability of materials behavior under varying external conditions such as temperature and pressure This immediately brings one face to face with the fundamental difficulty of establishing a connection between materials behavior at a microscopic level where understanding is to be sought and macroscopic behavior which needs to be predicted Bridging the corresponding gap in length scales that separates the ends of this spectrum has been a goal intensely pursued by theoretical physicists experimentalists and metallurgists alike Traditionally the search for methods to bridge the length scale gap and to gain the

needed predictive capability of materials properties has been conducted largely on a trial and error basis guided by the skill of the metallurgist large volumes of experimental data and often ad hoc semi phenomenological models This situation has persisted almost to this day and it is only recently that significant changes have begun to take place These changes have been brought about by a number of developments some of long standing others of more recent vintage

Molecular Beam Epitaxy Marian A. Herman, Helmut Sitter, 2013-03-08 This first ever monograph on molecular beam epitaxy MBE gives a comprehensive presentation of recent developments in MBE as applied to crystallization of thin films and device structures of different semiconductor materials MBE is a high vacuum technology characterized by relatively low growth temperature ability to cease or initiate growth abruptly smoothing of grown surfaces and interfaces on an atomic scale and the unique facility for in situ analysis of the structural parameters of the growing film The excellent exploitation parameters of such MBE produced devices as quantum well lasers high electron mobility transistors and superlattice avalanche photodiodes have caused this technology to be intensively developed The main text of the book is divided into three parts The first presents and discusses the more important problems concerning MBE equipment The second discusses the physico chemical aspects of the crystallization processes of different materials mainly semiconductors and device structures The third part describes the characterization methods which link the physical properties of the grown film or structures with the technological parameters of the crystallization procedure Latest achievements in the field are emphasized such as solid source MBE including silicon MBE gas source MBE especially metalorganic MBE phase locked epitaxy and atomic layer epitaxy photoassisted molecular layer epitaxy and migration enhanced epitaxy

Nanophase Materials G.C. Hadjipanayis, Richard W. Siegel, 2012-12-06 Nanophase Materials is the first and as yet the only comprehensive book published in this new and exciting area of materials science It gives a broad overview of the revolutionary new field of nanophase materials a view which spans the materials physics and chemistry research communities at a tutorial level that is suitable for advanced undergraduates graduate students postdoctoral researchers and experts or would be experts in the science of nanostructured materials The articles are authored by many of the world's most prominent scientists in this field The book covers the diverse methods for synthesizing nanophase materials a variety of subsequent processing methodologies what is known about the structures of these materials on various length scales from atomic to macroscopic and the properties of these unique and novel materials The materials properties covered are mechanical electronic optical and magnetic and hence span a wide range of important new opportunities for technological applications
