Journal of Dynamic Systems, Measurement, and Control, 1999 **Experimental Robotics VI** Peter I. Corke, James Trevelyan, 1999-10-22 This book presents the proceedings of the 6th International Symposium on Experimental Robotics held in Sydney in March 1999 The editors and contributors represent the leading robotics research efforts from around the world Micro machines interplanetary exploration minimally invasive surgery and emerging humanoid robots are among the most obvious attainments of leading robotics research teams reported in this volume Less obvious but equally significant are the fundamental advances in robot map building and methods of communication between humans and machines that are demonstrated through experimental results This collection of papers will provide the reader with a concise report on the current achievements and future trends in robotics research across the world **Methods and Applications of**

Intelligent Control S.G. Tzafestas, 2012-12-06 This book is concerned with Intelligent Control methods and applications The field of intelligent control has been expanded very much during the recent years and a solid body of theoretical and practical results are now available These results have been obtained through the synergetic fusion of concepts and techniques from a variety of fields such as automatic control systems science computer science neurophysiology and operational research Intelligent control systems have to perform anthropomorphic tasks fully autonomously or interactively with the human under known or unknown and uncertain environmental conditions Therefore the basic components of any intelligent control system include cognition perception learning sensing planning numeric and symbolic processing fault detection repair reaction and control action These components must be linked in a systematic synergetic and efficient way Predecessors of intelligent control are adaptive control self organizing control and learning control which are well documented in the literature Typical application examples of intelligent controls are intelligent robotic systems intelligent manufacturing systems intelligent medical systems and intelligent space teleoperators Intelligent controllers must employ both quantitative and qualitative information and must be able to cope with severe temporal and spatial variations in addition to the fundamental task of achieving the desired transient and steady state performance Of course the level of intelligence required in each particular application is a matter of discussion between the designers and users The current literature on intelligent control is increasing but the information is still available in a sparse and disorganized way Proceedings of the ASME Dynamic Systems and Control Division, 1998 **A Multiport Approach to Modeling and Solving Large-scale Dynamic Systems**
