**Calculation of the Longitudinal Aerodynamic Characteristics of Upper-surface Blown Wing-flap Configurations** Michael R. Mendenhall, Selden B. Spangler, 1978      **The Practical Calculation of the Aerodynamic Characteristics of Slender Finned Vehicles** National Aeronautics and Space Admini, James S Barrowman, 2025-05-22 The basic objective of this thesis is to provide a practical method of computing the aerodynamic characteristics of slender finned vehicles such as sounding rockets high speed bombs and guided missiles The aerodynamic characteristics considered are the normal force coefficient derivative  $c_{N_\alpha}$  center of pressure  $\bar{X}$  roll forcing moment coefficient derivative  $c_{l_\delta}$  roll damping moment coefficient derivative  $c_{l_p}$  pitch damping moment coefficient derivative  $c_{m_q}$  and the drag coefficient  $c_D$  Equations are determined for both subsonic and supersonic flow No attempts is made to analyze the transonic region The general configuration to which the relations are applicable is a slender axisymmetric body having three or four fins This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it This work was reproduced from the original artifact and remains as true to the original work as possible Therefore you will see the original copyright references library stamps as most of these works have been housed in our most important libraries around the world and other notations in the work This work is in the public domain in the United States of America and possibly other nations Within the United States you may freely copy and distribute this work as no entity individual or corporate has a copyright on the body of the work As a reproduction of a historical artifact this work may contain missing or blurred pages poor pictures errant marks etc Scholars believe and we concur that this work is important enough to be preserved reproduced and made generally available to the public We appreciate your support of the preservation process and thank you for being an important part of keeping this knowledge alive and relevant

*Hypersonic Speeds* H. Reese Ivey, 1948 A method is developed for calculating the pressures on aerodynamic shapes at very high supersonic speeds in dense air with the ratio of specific heats equal to 1 The method is applicable to any body of revolution at zero angle of attack and to any two dimensional profile The results of the present paper are compared with previous work of Von Karman and Epstein on this problem and the difference explained      **Calculation of High Angle of Attack Aerodynamics of Fighter Configurations** Chuan-Tau Edward Lan, H. Emdad, Sui Chin, P. Sundaram, S. C. Mehrotra, R. K. Tripathi, 1991 A computational method for lateral directional aerodynamics of fighter configurations is developed The leading edge vortices are represented by free vortex filaments which are adjusted iteratively to satisfy the force free condition The forebody vortex separation both symmetrical and asymmetrical is calculated using slender body theory Effect of boundary layer separation on lifting surfaces is accounted for using the effective sectional angles of attack The latter are obtained iteratively by matching the nonlinear sectional lift with the computed results based on lifting surface theory Results for several fighter configurations are employed for comparison with available data It is shown that the present method produces reasonable results in predicting sideslip derivatives while roll and yaw rate derivatives do not compare very well with forced oscillation test data at high angles of attack Industrial usage of this has produced mixed results At this time the use of these methods in a production manner is not recommended      **Calculation of the Aerodynamic Characteristics of Turbine Blading** Nikolai Mikhaïlovich Markov, 1958      Monthly Catalog of United States Government Publications, Cumulative Index United States.
