Abstract

Logic-based approaches for analyzing and evaluating arguments have been largely studied in recent years, yielding a variety of formal methods for argumentation-based reasoning. The goal of this paper is to provide an abstract, proof-theoretical investigation of logical argumentation, where arguments are represented by sequents, conflicts between arguments are represented by sequent elimination rules, and deductions are made by dynamic proof systems extending standard sequent calculi.

Keywords: logical argumentation, sequent calculi, dynamic derivations.

1 Introduction

Logical argumentation (sometimes called deductive argumentation) is a logic-based approach for formalizing debates, disagreements, and entailment relations for drawing conclusions from argumentation-based settings [6,12,13,15]. The basic entities in this context are called *arguments*. An argument is a pair of a finite set of formulas (Γ , the support set) and a formula (ψ , the conclusion), expressed in an arbitrary propositional language, such that the latter follows, according to some underlying logic, from the former. As indicated in [1] and [3], this gives rise to the association of arguments with Gentzen's notion of *sequents* [9], where an argument is expressed by a sequent of the form $\Gamma \Rightarrow \psi$. Accordingly, logical argumentation boils down to the exposition of formalized methods for reasoning with these syntactical objects.

Advances in Natural Deduction Luiz Carlos Pereira, Edward Haeusler, Valeria de Paiva, 2014-07-08 This collection of papers celebrating the contributions of Swedish logician Dag Prawitz to Proof Theory has been assembled from those presented at the Natural Deduction conference organized in Rio de Janeiro to honour his seminal research Dag Prawitz's work forms the basis of intuitionistic type theory and his inversion principle constitutes the foundation of most modern accounts of proof theoretic semantics in Logic Linguistics and Theoretical Computer Science The range of contributions includes material on the extension of natural deduction with higher order rules as opposed to higher order connectives and a paper discussing the application of natural deduction rules to dealing with equality in predicate calculus The volume continues with a key chapter summarizing work on the extension of the Curry Howard isomorphism itself a by product of the work on natural deduction via methods of category theory that have been successfully applied to linear logic as well as many other contributions from highly regarded authorities With an illustrious group of contributors addressing a wealth of topics and applications this volume is a valuable addition to the libraries of academics in the multiple disciplines whose development has been given added scope by the methodologies supplied by natural deduction The volume is representative of the rich and varied directions that Prawitz work has inspired in the area of natural deduction

Perspectives on Deduction: Contemporary Studies in the Philosophy, History and Formal Theories of Deduction Antonio Piccolomini d'Aragona, 2024-04-01 This book provides philosophers and logicians with a broad spectrum of views on contemporary research on the problem of deduction its justification and explanation The variety of distinct approaches exemplified by the single chapters allows for a dialogue between perspectives that usually barely communicate with each other The contributions concern in a possibly intertwined way three major perspectives in logic philosophical historical formal The philosophical perspective has to do with the relationship between deductive validity and truth and questions the alleged conclusiveness of deduction and its epistemic contribution It also discusses the role of linguistic acts in deductive practice and provides a cognitive didactic contribution on how we may learn through deduction In the historical perspective the contributions discuss the ideas of some major historical figures such as Bolzano Girard G del and Peano Finally in the formal perspective the mathematics of deduction is dealt with mainly from an intuitionistic constructivist or proof theoretic point of view with focus on ecumenic or internalistic approaches to logical validity on the nature and identity of proofs and on dialogical setups Chapter 14 is available open access under a Creative Commons Attribution 4.0 International License via link.springer.com

inference based meaning theories have been extremely influential in the development of modern proof theory and anti realistic semantics In particular Prawitz is the main author on natural deduction in addition to Gerhard Gentzen who defined natural deduction in his PhD thesis published in 1934 The book opens with an introductory paper that surveys Prawitz s numerous contributions to proof theory and proof theoretic semantics and puts his work into a somewhat broader perspective both historically and systematically Chapters include either in depth studies of certain aspects of Dag Prawitz s work or address open research problems that are concerned with core issues in structural proof theory and range from philosophical essays to papers of a mathematical nature Investigations into the necessity of thought and the theory of grounds and computational justifications as well as an examination of Prawitz s conception of the validity of inferences in the light of three dogmas of proof theoretic semantics are included More formal papers deal with the constructive behaviour of fragments of classical logic and fragments of the modal logic S4 among other topics In addition there are chapters about inversion principles normalization of proofs and the notion of proof theoretic harmony and other areas of a more mathematical persuasion Dag Prawitz also writes a chapter in which he explains his current views on the epistemic dimension of proofs and addresses the question why some inferences succeed in conferring evidence on their conclusions when applied to premises for which one already possesses evidence
