Deep-water Traction Current Deposits Zhenzhong Gao, Gao Zhenzhong, 1998 Supported by National Natural Foundation *Oceanic Internal Tides: Observations, Analysis and Modeling Eugene G. Morozov, 2018-02-08 This book presents* of China a detailed study of the structure and variability of internal tides and their geographical distribution in the ocean Based on experimental analysis of oceanic measurements combined with numerical modeling it offers a comprehensive overview of the internal wave processes around the globe In particular it is based on moored buoys observations in many regions in all oceans Atlantic Pacific Indian Arctic and Southern that have been carried out by researchers from different countries for more than 40 years as part of various oceanographic programs including WOCE and CLIVAR However a significant portion of the data was collected by the author who is a field oceanographer. The data was processed and interpreted on the basis of the latest knowledge of internal wave motion The properties of internal waves were analyzed in relation to the bottom topography and mean state of the ocean in specific regions Internal waves play a major role in the formation of seawater stratification and are responsible for the main processes of ocean dynamics such as energy transfer and mixing One of the most significant ideas presented in this book is the generation of internal tides over submarine ridges Energy fluxes from submarine ridges related to tidal internal waves greatly exceed the fluxes from continental slopes Submarine ridges form an obstacle to the propagation of tidal currents which can cause the creation of large amplitude internal tides Energy fluxes from submarine ridges account for approximately one fourth of the total energy dissipation of the barotropic tides Model simulations and moored measurements have been combined to generate a map of global distribution of internal tide amplitudes This book is of interest to oceanographers marine biologists civil engineers and scientists working in climate research fluid mechanics acoustics and underwater navigation DEEP WATER INTERNAL WAVES STUDY. Alfred J. Carsola, LOCKHEED-CALIFORNIA CO BURBANK., 1967 Two arrays of thermistors were installed and operated off San Clemente Island California for several months in 1964 and from 5 August 1965 to 16 January 1966 For the latter array thermistors at 240 and 340 were inoperative after 3 September 1965 but data are available for the thermistors at 1640 and 1740 from 5 August 1965 to 16 January 1966 Spectra of temperature fluctuations show little statistical energy at frequencies above 0 04 cycles per minute corresponding to periods below 25 minutes Only rarely was the frequency corresponding to 0 01C cy min greater than 006 cpm period of 166 minutes or about 3 hours Some peaks occasionally appear at frequencies higher than 0 04 cpm but these are small and probably not significant The spectra for the longest continuous records from 18 November to 27 December 1966 show two peaks one at approximately 12 hours and the other between 24 and 32 hours Results of these experiments emphasize the dominance of tidal periods in thermal fluctuations and indicate that relationships between surface and internal tides should be clearly established These results are in substantial agreement with those obtained by other investigators in the past decade Author
