Crc Handbook Of Viruses:

CRC Handbook of Viruses Infecting Legumes John R. Edwardson, Richard G. Christie, 1991-09-11 This interesting handbook discusses 145 plant viruses in 27 groups and 31 unclassified viruses in naturally infected legumes. The viruses were observed in field infections of 281 species in 64 genera of the Leguminosae. The book presents information regarding resistance sources and resistance breeding vectors, seed transmission and host ranges. Measurements of virus properties are organized in tabular form for particle dimensions, serological relationships, nucleic acid percentages, sedimentation coefficients of particles and nucleic acids, molecular weights of nucleic acids and coat proteins, optical density and buoyant density. Handbook of Viruses Infecting Legumes is unique in that it relates inclusion cytology to plant virus detection, identification and classification. Light and electron micrographs illustrate morphology, location and staining reactions of inclusions. Of the 27 groups that contain viruses infecting legumes in nature, inclusions are diagnostic at the group level in 15 of these groups. Plant breeders, diagnosticians, plant virologists and students of plant virology will find this an indispensable guide to legume viruses.

CRC Handbook of Viruses Horace M. Mazzone, 1998-05-13 As a distinct class of macromolecules, viruses are continually being studied in order to determine their properties. Following a knowledge of host range, infectivity, the particle mass, molecular weight of the virus and related properties including size, shape, sedimentation and diffusion coefficients are also important characterizations. In the literature, these values have been determined for many viruses and a variety of techniques are available by which such properties may be analyzed. Until now, there has been no single source for such information that the interested investigator may consult and no databases provided this kind of information. CRC Handbook of Viruses: Mass, Molecular Weight Values and Related Properties corrects this deficiency by presenting such data for all classes of viruses, centering on viruses, their molecular weight and their related properties and acquainting the investigator to many methods for obtaining the mass, molecular weight value of viruses. This singular study explains the variety of methods available to the researcher as well as provides examples of each method. Molecular weight values are accessed directly from the book, saving the investigator a tedious search through the range of literature. Chapters discuss Viruses as infectious agents and their role in establishing the relatively new discipline of molecular biology. Essential components of viruses: protein and nucleic acid, considering their discovery, nature, structural organization and the forming of viruses from nucleoproteins. Basic aspects of virus purification: preparative centrifuge and various purification methods. Basic aspects of crystallography including procedures: x-ray analysis of the viral protein component, the arranging of subunits and the composition of the intact virus. Sedimentation experiments and studies used to obtain molecular weight. Sedimentation and diffusion coefficients integral to the basic Svedberg equation. Sedimentation equilibrium procedures. The new Beckman Optima series of analytical ultracentrifuges. Scattering studies including small angle x-ray, small angle neutron, classical light scattering and electron microscopy. The renaissance of instrumentation in classical light scattering techniques. Cold neutron

facilities currently being set into operation by government laboratories Sizing and solvation of viruses in solution their natural environment Critical modeling experiments Facilities and instrumentation for molecular weight studies including the high voltage transmission electron microscope for obtaining mass values of viral inclusion bodies CRC Handbook of Viruses serves the Researcher seeking values of virus molecular weight and related parameters Investigator getting started in virology and seeking information on physical chemical procedures Student interested in viruses as infectious agents

CRC-handbook of microbiology Allen I. Laskin, Hubert A. Lechevalier, 1978 **CRC Handbook of Microbiology** Allen I. Laskin, Hubert A. Lechevalier, Chemical rubber company, 1978 CRC Handbook of Microbiology: Fungi, algae, protozoa, and viruses, 1977 Desk Encyclopedia of Plant and Fungal Virology Marc H.V. van Regenmortel, Brian W.J. Mahy, 2009-10-13 This volume consists of 85 chapters that highlight recent advances in our knowledge of the viruses that infect plants and fungi It begins with general topics in plant virology including movement of viruses in plants the transmission of plant viruses by vectors and the development of virus resistant transgenic plants The second section presents an overview of the properties of a selection of 20 well studied plant viruses 23 plant virus genera and a few larger groups of plant viruses The third section which is abundantly illustrated highlights the most economically important virus diseases of cereals legumes vegetable crops fruit trees and ornamentals The last section describes the major groups of viruses that infect fungi The most comprehensive single volume source providing an overview of virology issues related to plant and fungi Bridges the gap between basic undergraduate texts and specialized reviews Concise and general overviews of important topics within the field will help in preparation of lectures writing reports or drafting grant applications The Insect Viruses Lois K. Miller, L. Andrew Ball, 2012-12-06 There are over a million different species of insects and individually they 8 outnumber humans by more than 10 to 1 Moreover some insects live in close association with both plants and higher animals and naturally exchange viruses with them It has even been speculated that viruses in general may have radiated through the plant and animal kingdoms from common insect origins Be that as it may since insects play pivotal roles in the biosphere both to the benefit and detriment of mankind they and the viruses that infect them are important subjects for study Insects are infected by a diverse medley of viruses and this volume focuses on those insect virus families that are found primarily or exclusively in insects All major families of insect selective viruses are covered except for the baculo viruses which were described in a separate volume of The Viruses series Included in this volume are the established families of insect viruses the newly recognized ascovirus family and the nudiviruses which probably represent a separate family but currently remain unclassified The coverage of arboviruses is limited to a single chapter that focuses on their potential utility as vectors and in insect control Omitted for practical reasons are several individual insect viruses that have been described sporadically in the literature and probably represent novel virus families *Handbook of Viral and Rickettsial Hemorrhagic Fevers* James H.S. Oxford, 2018-10-24 Originally it was our intention to produce a single volume book covering all aspects and approaches to the problem of specific inhibitors of respiratory viruses However as the work progressed it became obvious that certain chapters because of the research interests of the authors concentrated particularly on influenza viruses It seemed logical therefore to divide the book into two volumes the first emphasizing influenza and the second concentrating on other viruses as well as discussing important general aspects of drug screening and clinical testing although the second volume does have some chapters which deal mainly with influenza **Infectious Diseases of Wild Mammals** Elizabeth S. Williams, Ian K. Barker, 2008-02-28 Infectious Diseases of Wild Mammals Third Edition presents the latest information on the diagnosis and treatment of infectious disease in both free ranging and captive wild mammals Editors Elizabeth Williams and Ian Barker have recruited 71 contributors all noted experts in their fields to update this new edition This reference provides valuable information on each disease including Etiology History Distribution Epidemiology Clinical signs Pathology Immunity Diagnosis Treatment Control This latest edition is a leading reference book for Wildlife biologists managers and rehabilitators Biology students Conservationists Public health workers *Encyclopedia of Virology* Brian W. and Other Solanaceous Crops John Richard Edwardson, 1997 Agents Transmissible from Simians to Man Manfred Brack, 2012-12-06

The contacts between man and nonhuman primates enable the transmission of microorganisms from one species to the other. Such contact may occur at quite different levels: man and nonhuman primates may share the same ecosystem including the presence of vectors in the countries of origin of monkeys and apes; the animals are captured to be sold or used for food; field researchers have to stay near the animals in the wild; an uncontrolled human population gets close enough to almost touch the animals in zoological gardens around the world; pet owners establish bodily contact and finally researchers doing surgery or necropsies are exposed to an increased number of pathogens liberated from the organs and body fluids. Usually monkeys and apes are more threatened with catching the microorganisms indigenous to man than vice versa, but nevertheless outbreaks of true zoonoses with nonhuman primates as the source of infection have occurred. Also the retransmission of originally human pathogens via nonhuman primates to man may pose a considerable risk to human health. Unfortunately the information on the different agents transmissible between man and his relatives is too disseminated for practical use as it involves quite different scientific disciplines such as virology, bacteriology, parasitology, primatology, laboratory animal science etc. It seemed therefore necessary to compile the current knowledge concerning this topic in a single publication. Human infections of simian origin may be caused by several viruses, bacteria, fungi or endoparasites. Ectoparasites in comparison are of little importance.

CRC Handbook of Viral and Rickettsial Hemorrhagic Fever James H.S. Gear, 1988-05-31. This standard reference book deals with the diagnosis, treatment, control and prevention of the hemorrhagic fevers which have attracted attention throughout the world because of their severity, high death rate and their danger to medical and nursing personnel. In Africa they include the recently recognized Lassa fever, Marburg and Ebola virus diseases as well as yellow fever, feared for centuries, and Rift Valley fever. In South America where yellow fever still occurs, Junin and Machupo viruses related to Lassa virus cause Argentinian and Bolivian hemorrhagic fevers respectively. Dengue, Korean, Omsk and Kyasanur hemorrhagic fevers are examples of these conditions occurring in Asia. Crimean Congo hemorrhagic fever occurs widely in South Eastern Europe, Asia and Africa. Rickettsial infections are often complicated by hemorrhagic states. Each chapter is written by a well known authority and is well illustrated.
