Epigenetic Modifications and Viral Infections Silvia Carolina Galvan, Alejandro García Carrancá, Félix Recillas-Targa, Jiuzhou Song, 2015-07-09 Epigenetics is defined as the study of modifications of the genome heritable during cell division that does not involve changes in DNA sequences Up to date epigenetic modifications involve at least three general mechanisms regulating gene expression histone modifications DNA methylation and non coding RNAs ncRNAs For the past two decades an explosion in our interest and understanding of epigenetic mechanisms has been seen This mainly based on the influence that epigenetic alterations have on an amazing number of biological processes such as gene expression imprinting programmed DNA rearrangements germ line silencing developmentally cued stem cell division and overall chromosomal stability and identity It has become also evident that the constant exposure of living organisms to environment factors affects their genomes through epigenetic mechanisms Viruses infecting animal cells are thought to play central roles in shaping the epigenetic scenario of infected cells In this context it has become obvious that knowing the impact that viral infections have on the epigenetic control of their host cells will certainly lead to a better understanding of the interplay viruses have with animal cells In fact DNA viruses use host transcription factors as well as epigenetic regulators in such a way that they affect epigenetic control of gene expression that extends to host gene expression At the same time animal cells employ mechanisms controlling transcription factors and epigenetic processes in order to eliminate viral infections In summary epigenetic mechanisms are involved in most virus cell interactions We now know that some viruses exhibit epigenetic immune evasion mechanisms to survive and propagate in their host however there is still much ambiguity over these epigenetic mechanisms of viral immune evasion and most of the discovered mechanisms are still incomplete Other

animal viruses associated to cancer often deregulate cellular epigenetic mechanisms silencing cellular tumor suppressor genes and or activating either viral or host cell oncogenes In addition in several cancers the down regulation of tumor suppressor protein coding genes and ncRNAs with growth inhibitory functions such as miRNAs have been closely linked to the presence of cell CpG island promoter hypermethylation The goal of the aforementioned Research Topic is to bring together the key experimental and theoretical research linking state of the art knowledge about the epigenetic mechanisms involved in animal virus cell interactions
